CHAPTER V
CONCLUSION AND SUGGESTION

5.1 Conclusion

The conclusions obtained after doing this research are:

1. Projects that are integrated into innovative learning material on analytical materials can facilitate students in learning activities with the result 3.61.
2. Based on the research developing learning materials for students in the teaching anion analysis is possible. Prove on the average value of activity based on psychomotor questionnaire that is 88.05 and very good.
3. Responses of student respondents to the project in learning material on anion analysis material is very positive and assess the average of 88-91% learning material affect student learning motivation.

5.2 Suggestion

Based on the results of research that has been done, the authors suggest:

1. Before using the learning material as a learning resource, educators should also learners already know the SC and BC courses, so as to choose the appropriate learning materials and meet the learning objectives, in addition to create a real learning atmosphere would be better if in learning materials along with activities that encourage students to be active in learning.
2. Chemistry learning material recommended in teaching and learning process, because it has been standardized.
3. For the next researcher is better using observation sheet for students as authentic data while teaching and learning process and also can improve the material based on their check

THE Character Building UNIVERSITY
