Dear Thamrin Thamrin,

Thank you for your submission.

Submission ID	227363414
Manuscript Title	Key Factors to Foster Academic Performance in Online Learning Environment. An Evidence From Indonesia During COVID-19 Pandemic
Journal	Cogent Education
Article Publishing Charge (APC)	USD \$617.50 (plus VAT or other local taxes where applicable in your country)

**APC only payable if your article is accepted*

You can check the progress of your submission, and make any requested revisions, on the Author Portal.

Thank you for submitting your work to our journal.

If you have any queries, please get in touch with OAED-peerreview@journals.tandf.co.uk.

For any queries relating to your APC, please get in touch with APC@tandf.co.uk

Kind Regards,
Cogent Education Editorial Office

Manuscript I

Key Factors to Foster Academic Performance in Online Learning Environment. An Evidence From Indonesia During COVID-19 Pandemic

The unprecedented COVID-19 pandemic has changed how we live the life, including education. While online learning aims to avoid the transmission of viruses, however, what causes the success or failure of online learning needs to be investigated. This study tries to answer the question by analyzing how self-regulated learning, digital literacy, and the mediation of course satisfaction influence students' academic performance in online learning situations caused by the COVID-19 pandemic in Indonesia. We employed Partial Least Square Structural Equation Modelling (PLS-SEM) on 358 respondents gathered from an online survey questionnaire completed by undergraduate students during the pandemic. The study finds that self-regulated learning is the key factor, followed by digital literacy. Course satisfaction also proved to mediate self-regulated learning and digital literacy on academic performance.

Keywords: Indonesia; PLS-SEM; online learning; self-regulated learning; digital literacy

Introduction

It has been two years since the COVID-19 pandemic was officially declared to have entered Indonesian territory. Many aspects have changed caused by social distancing, from partial until full lockdowns. Numerous things are becoming the new norm today, such as people being required to wear masks when in public spaces, places usually used as gathering places being limited in capacity and operating hours, and places of worship have been temporarily closed. Among them, the most striking thing since the pandemic is that teaching and learning activities in schools and campuses are not allowed and replaced with online learning, not only in Indonesia but school closure is also implemented throughout the global level. Following UNESCO recommendations, educational institutions are encouraged to replace the face-to-face learning process with

online learning (Crawford et al., 2020).

The application of a learning management system (LMS) in online learning is challenging. This challenge comes from two sources. Firstly, it is caused by the physical absence of lecturers, and secondly is caused by the loss of the campus academic atmosphere, so that students tend to use their productive time to do other things besides studying (Elvers et al., 2003; Levy & Ramim, 2012; Michinov et al., 2011). Because online learning has powerful characteristics in self-autonomy, self-regulation has an important role in the process. In the context of learning in regular classrooms, self-regulatory behaviors have been shown to play an important role in students' academic performance (Lan, 1996; Orange, 1999). If this behavior has a vital role in regular classrooms, then it can be expected that self-regulatory skills will play an even much more critical role in online learning, where students are isolated from each other in their respective rooms. Students who lack self-regulatory learning skills are suspected of manipulating their self-autonomy so that the learning tasks they should have completed in online courses are unfinished.

In addition to self-regulated learning, the ability to use digital devices, or known as digital literacy also plays an important role here. This is because online learning is not only about using devices to access the LMS, but also how to synthesize information and prevent risks that may occur when accessing the internet (Rodríguez-de-Dios & Igartua, 2016). If the understanding of literacy in the past meant demonstrating the capacity to extract sense from what they read (Prior et al., 2016), then digital literacy also has similar characteristics, because the skill to read and to write was not enough to identify a person as being literate (Miranda et al., 2018). A person can be said to have digital literacy if they have the ability to understand and use various information that they obtained from a variety of digital sources (Gilster, 1997).

Researchers have revealed that self-regulated learning influences students' course satisfaction (Kuo et al., 2014; Puzziferro, 2008; Wang et al., 2013). If explored further, course satisfaction is known to have implications for student academic performance (Blanz, 2014; Topalã, 2014). Also, based on the previous study, self-regulated learning and digital literacy are known to influence academic performance directly, but previous research has only focused more on the regular classroom setting (Bail et al., 2008; Leung & Lee, 2012; Lucieer et al., 2016; Vrana, 2014). However, as far as the authors know, there is no study about how digital literacy influences course satisfaction in the online learning environment, even though in the online learning process the use of digital devices is absolutely necessary. Regarding how course satisfaction in mediating digital literacy and self-regulated learning on academic performance also has never been studied before. Thus, this study aims to fill these gaps by investigating them. Again, this study becomes important because it captures a broader understanding of how self-regulated learning, digital literacy, and course satisfaction influence students' academic performance in online learning situations caused by the unprecedented COVID-19 pandemic in Indonesia.

Theoretical background and hypothesis development

Self-regulated learning

In online learning, students have complete control over their learning. Thus, they must do things independently related to their learning, including planning, regulating, monitoring, and evaluating. Successful self-regulated learning is characterized by active engagement, adjustment, and readjustment of learning strategies according to various factors they met. According to Zimmerman (2000), self-regulation is defined as self-generated thoughts, feelings, and actions that are planned and cyclically adjusted to achieve personal goals.

Meanwhile, Bandura (1986) states that self-regulated learning represents the relationship between triadic processes, namely personal, behavior and environment. Furthermore, when referring to Schunk & Ertmer (2000), self-regulation is a cycle when personal, environmental, and behavioral aspects experience changes during the learning process.

Students who carry out online learning need to be independent and autonomous, though they are also expected to be able to carry out self-management. Self-regulated learning has much in common with learners' ability to exert self-control, and previous literature has shown that aspects such as resisting temptation, resisting distractions, focusing on long-term goals, delaying short-term gratification, are all part of self-regulation (Zhu et al., 2016). But of course, in reality, this is not an easy thing to maintain (Elvers et al., 2003; Levy & Ramim, 2012; Michinov et al., 2011). Previous literature states that self-regulation in online learning settings tends to create learning difficulties for students compared to face-to-face learning (Lajoie & Azevedo, 2006; Lee et al., 2008; Samruayruen et al., 2013; Tsai & Tsai, 2010). Furthermore, if not managed properly, an unorganized profile from the aspect of self-regulated learning is associated with poor academic outcomes, such as a low GPA of students (Barnard et al., 2009).

Digital Literacy

The concept of digital literacy has changed in recent years, and even this term is often confused, as there is no general consensus among academics on its definition (Bawden, 2001, 2008; Hockly, 2012). Initially, this term expressly referred to knowledge of hardware and software. Thus, someone is considered to have digital literacy if they know how to use a word processing application such as Microsoft Word. Furthermore, along with the advancement of internet technology, until around the 1990s, some academics used this term to refer to the ability to read and understand the hypertextual text and multimedia (Bawden, 2001). Nevertheless, this concept is seen as more than just using

the software or the device itself. Therefore, it relates to expertise and skills in the use of mechanics as well as knowledge and skills about using these devices for different purposes (Chisholm, 2006). Thus, the importance of technology is not only seen from the technology side, but the intellectual, social, and ethical use that we make and the concept of digital literacy must also be considered.

Thus, digital literacy can be interpreted as an individual's awareness, attitude, and ability to use digital tools and facilities appropriately to identify, access, manage, integrate, evaluate, analyze and synthesize digital resources, build new knowledge, create media expressions, and communicate with others, in the context of specific life situations, to enable constructive social action, and for reflection (Hockly, 2012; Martin, 2005). Although today's generation is digital natives (Al-htaybat et al., 2018) and they are at the forefront of new technologies, it is not a guarantee that they will be able to use them wisely because today's generation has many difficulties managing information, assessing the credibility of information, building their digital identity, and manage privacy in their online activities (Fernández-Villavicencio, 2012). Furthermore, referring to Rodríguez-de-Dios & Igartua (2016), there are five dimensions of digital literacy, namely:

- Technological or Instrumental Skill
- Communication Skill
- Information Skill
- Critical Skill
- Security Skill

Course Satisfaction

Concerning terminology about satisfaction in education, it is often referred to by different names, such as student satisfaction (Xiao & Wilkins, 2015), learning satisfaction (Topala

& Tomozii, 2014), and course satisfaction (Frey et al., 2003; Wang et al., 2013). However, this study uses the term of course satisfaction. In most countries, students are required to pay tuition fees, then, like consumers in business sector, their satisfaction needs to be considered by universities (Xiao & Wilkins, 2015). Referring to Rashidi & Moghadam (2014) , course satisfaction can be interpreted as the relationship between students' expectations and what they actually get. Therefore, students with high course satisfaction will tend to earn higher grades in their final exam (Puzziferro, 2008). As a result, the success of online learning is when students are satisfied with their learning experience, and then students experience success in learning the course content (Chang & Smith, 2008; Marks et al., 2005; Puzziferro, 2008).

Based on the theoretical grounding and previous findings, we propose five hypotheses as follows:

H1: Self-regulated learning has a significant positive direct effect on course satisfaction

H2: Digital literacy has a significant positive direct effect on course satisfaction

H3: Course satisfaction has a significant positive direct effect on academic performance

H4: Course satisfaction mediates the relationship between self-regulated learning and academic performance

H5: Course satisfaction mediates the relationship between digital literacy and academic performance

Research Model

The model proposed in this study can be seen in figure 1, which generated by the theoretical grounding and hypotheses postulated. In this model, self-regulated learning

and digital literacy act as an exogenous latent variable. Meanwhile, the course satisfaction variable acts as an endogenous latent variable with a dual relationship as both independent and dependent, and the academic performance variable acts as an endogenous latent variable.

Method

Research design and sample

This study used survey research design as its research procedure. Survey research designs are methods in quantitative research in which researchers administer a survey to a sample or to the entire population of people to describe the attitudes, opinions, behaviors, or characteristics of the population (Creswell, 2012). Furthermore, the type of survey research design used is cross-sectional survey designs, where data is collected at one point in time (Creswell, 2012). In this study, the sample was selected using convenience sampling procedure. In determining the sample size, the authors followed the recommendations given by Hair Jr et al. (2016), where to determine the required number of samples, it should be in line with the statistical power. To calculate the required sample size and the statistical power, the authors utilized G*Power software (Faul et al., 2007). The authors used error measurements of type one and two at $\alpha = 0.05$ and $\beta = 0.95$, while the effect size = 0.15, and the number of predictors as the model offered by the researcher is 3, with 2 number of tested predictors. The calculation shows that the minimum sample required in this study is 107. Furthermore, the complete settings authors used to analyze the sample size and the results can be seen in Figure 2. The sample consisted of undergraduate students who studied in two universities in Indonesia.

Instrumentation and data collection

The instruments used in data collection in this study have been validated by previous research. The self-regulated learning variable uses the Online Self-Regulated Learning Questionnaire (OSLQ) (Barnard et al., 2009), the digital literacy variable uses an instrument developed by Rodriguez-de-Dios et al. (2016). Meanwhile, the learning satisfaction variable was adopted from the Course Satisfaction Questionnaire (CSQ) instrument (Frey et al., 2003), and academic performance using an instrument that has been validated by Nayak (2018). All variables were measured by utilizing five points Likert scale, where 1 refers to 'strongly disagree' and 5 refers to 'strongly agree'.

In data collection, authors conducted a web-base survey among Indonesian students. The number of completed questionnaires was 358, where this sample size fulfilled the minimum sample calculated using the G*Power application (107 sample size).

Sample demographic background

Table 1 shows the background of the sample who participated in this study. The categories of all samples (n = 358) are divided into gender, university, and the most frequent devices used in online learning. More than half were female (69.55%), and the remaining were male (30.45%). In terms of universities, the number of samples from the two universities was still relatively comparable in size, with 201 samples from Universitas Negeri Medan (56.15%), while those from Universitas Islam Negeri Sumatera Utara were 157 (43.85%). Interestingly, based on the devices used in attending online lectures, the majority of the samples participating in this study used mobile phones in online learning, with a total of 300 (83.8%), and the remaining using laptops (16.2%).

Table 1. Sample demographic background

		Frequency	Percentage
Gender	Male	109	30.45
	Female	249	69.55
University	Universitas Negeri Medan	201	56.15
	Universitas Islam Negeri Sumatera Utara	157	43.85
The most frequent devices used	Laptop	58	16.20
	Handphone	300	83.80

Data analysis procedure

Because the constructs authors want to examine are complex and contain two layers of constructs thus, the hierarchical component models (HCMs) in Partial Least Square Structural Equation Modeling (PLS-SEM) were employed for data analysis. HCMs have two elements: the higher-order component (HOC), which captures the more abstract higher-order entity, and the lower-order components (LOCs), which capture the subdimensions of the higher-order entity (Hair Jr et al., 2016). Furthermore, the type of HCMs used in this study is reflective-formative type models (Type II). Regarding the approach to estimate the HCMs, there are three approaches to estimate the parameters in HCMs models using PLS-SEM, they are the repeated indicator approach (Lohmöller, 2013; Wold, 1982), the two-stage or sequential approach (Ringle et al., 2012; Wetzels et al., 2009), and the hybrid approach (Becker et al., 2012; Ciavolino & Nitti, 2013). However, authors used repeated indicator with Mode B formative measurement to estimate the parameters in HCMs in this study. The advantage of the repeated indicator approach is its capability to assess all constructs simultaneously instead of assessing lower-order and higher-order dimensions separately (Becker et al., 2012). Mode B for the repeated indicator also considers to more appropriate referring to Becker et al. (2012).

In general, PLS-SEM chosen with the reason of the nature of this research is exploratory and predictive (Hair Jr et al., 2016; Henseler et al., 2016). In addition, the

utilization of PLS-SEM is also preferred because it allows researchers to approximate complex models with many constructs, indicators, and structural paths without having to worry about distributional assumptions on research data since PLS-SEM is non-parametric in nature (Hair Jr et al., 2016). Three main steps were conducted in analyzing the results: (1) evaluation of measurement models for first-order constructs, (2) evaluation of the first-order constructs on the second-order constructs, (3) evaluation of the structural model (Becker et al., 2012; Hair Jr et al., 2016; Ringle et al., 2015). The explanation for both evaluations will be explained in the next session.

Results

Evaluation of measurement models for first-order constructs

The first-order constructs in this study have reflective constructs. The assessment of reflective constructs involves convergent validity, internal consistency reliability, and discriminant validity (Hair Jr et al., 2016). Convergent validity is the degree to which a measure correlates with other measures of the same construct (Hair Jr et al., 2016)

requiring both loading factors and Average Variance Extracted (AVE) to exceed 0.5. Furthermore, internal consistency reliability is a form of reliability used to determine whether the items measuring a construct are similar in their scores. It required composite reliability and Cronbach's alpha to be above 0.6. The last aspect in evaluating the measurement models for first-order constructs is discriminant validity. While there are many approaches to evaluating the discriminant validity, such as cross-loading (Henseler et al., 2009), Fornell-Larcker criterion (Fornell & Larcker, 1981), and Heterotrait-monotrait ratio (HTMT) (Henseler et al., 2015). HTMT is considered to have a more accurate examination since cross loading and Fornell-Larcker criterion suffer to recognize discriminant validity issues (Henseler et al., 2015). For the threshold, the HTMT confidence interval must not include 1. For a more conservative threshold, 0.85 seems warranted (Henseler et al., 2015).

However, the results shown in Table 2 are the second run analysis. In the first analysis, the measurement that does not meet the requirements has been removed, namely SRL13, SRL14, SRL15, DL6, DL 7, DL8, DL22, DL23, DL24, and DL25. Table 2 shows that all constructs have adequate convergent validity, internal consistency reliability, and discriminant validity. Nonetheless, the details of HTMT results can be seen in Table 3. Once it is confirmed that the evaluation of measurement models for first-order constructs is viable, then it can proceed to the evaluation of the second-order constructs.

Table 2. Convergent validity and internal consistency reliability measures

Evaluation of the first-order constructs on the second-order constructs

The evaluation of the second order follows the same process or analogy used to evaluate the first order constructs (Chin, 1998). However, since the second order is formative, several researchers have emphasized that traditional validity assessments do not apply like its reflective counterpart (Götz et al., 2010; Hair Jr et al., 2016; Henseler et al., 2009; Petter et al., 2007). Fundamentally, formative models assume that the indicators have an influence or shape the construct (Hair Jr et al., 2016; Jarvis et al., 2003). It makes a different interpretation and evaluation of the measurement (Götz et al., 2010; Hair Jr et al., 2016). Thus, in general, the evaluation of the second-order constructs contains two steps: the indicator level (in which the first-order constructs now act as indicators), and the second-order constructs (Henseler et al., 2009).

In the first stage, we need to assess whether every first-order construct contributes to forming the second-order construct (Chin, 1998; Hair et al., 2011). However, as a reminder, we treated the path as weights instead of loading factor. Note that the weights obtained are the scores we obtained in the first stage. Referring to Andreev et al. (2009), the indicators' weight should exceed 0.1. Furthermore, bootstrapping should be employed to verify the significance (Hair et al., 2011; Henseler et al., 2009). Table 4 shows that all first-order constructs' weights are higher than 0.10 and have a significant level based on 5,000 bootstrapping, which means there is empirical support for the first-order constructs in terms of the construction of the formative second-order constructs (Hair et al., 2011).

Furthermore, it is necessary to assess the nomological validity at the second-order construct level. This validity manifested in the magnitude and significance of the relationships between the second-order formative construct with the other constructs in the model (Henseler et al., 2009). The results in Table 5 indicate a significant relationship

between second-order formative constructs in this study and other constructs in the model. It means the nomological validity has been met.

Table 4. Weights of the first order constructs on the second-order constructs

Construct level		Weight	t	Mean	Standard Deviation
Second-order construct	First-order construct				
Self regulated learning	Goal setting	0.29	29.13***	0.29	0.01
	Environment structuring	0.19	22.97***	0.19	0.01
	Task strategies	0.26	36.34***	0.26	0.01
	Help-seeking	0.25	29.44***	0.25	0.01
	Self-evaluation	0.21	34.55***	0.21	0.01
Digital literacy	Technological skill	0.26	32.18***	0.25	0.01
	Personal security skill	0.21	27.05***	0.21	0.01
	Critical skill	0.32	36.71***	0.32	0.01
	Device security skill	0.24	28.30***	0.24	0.01
	Communication skill	0.16	23.90***	0.16	0.01

Notes: ***Significant at 0.001 level based on 5,000 bootstraps; **significant at 0.01 level based on 5,000 bootstraps; *significant at 0.05 level based on 5,000 bootstraps

Evaluation of the structural model (inner model)

After the outer model is proven to be reliable and valid, then the inner model estimates should be examined for the sake of hypothesized relationships among constructs in the model (Hair et al., 2012; Hair Jr et al., 2016). However, PLS-SEM is different from CB-SEM. It makes the goodness-of-fit of CB-SEM not fully transferrable to PLS-SEM. Therefore, the inner model goodness-of-fit in this study was evaluated following Chin & others (1998), Henseler et al. (2009), and Hair Jr et al. (2016). Furthermore, the standardized path coefficients and significance levels with 5,000 bootstrapping allow researchers to test the proposed hypotheses.

Many researchers rely on R² to examine the explained variance of the endogenous constructs. However, since the second-order constructs in the model of this study use repeated indicators, surely the variance of the second-order construct will be perfectly explained, and the explained variance will be equal to 1. Therefore, another approach is used, known as the Stone-Geisser's Q^2 (Geisser, 1975; Stone, 1974). In the PLS-SEM application, this approach follows a blindfolding procedure and then tries to estimate the omitted part using the estimated parameters (Vinzi et al., 2010). In this study, researchers used SmartPLS blindfolding feature with the omission distance used was 7. This value follows the recommendation by Chin (1998) and Henseler et al. (2012) that omission distance should be between 5 and 10. For interpretation, if $Q^2 > 0$, it means the model has predictive relevance. However, if $Q^2 < 0$ it represents a lack of predictive relevance (Henseler et al., 2009; Vinzi et al., 2010).

Besides Q^2 , numerous scholars (Hair Jr et al., 2016; Henseler et al., 2009; Ringle et al., 2020) also recommended evaluating the effect size of each path using f^2 (Cohen's effect size) (Cohen, 2013). Values between 0.02 and 0.15, between 0.15 and 0.35, and over 0.35 represents small, medium, and large effect size, respectively (Henseler et al.,

2012; Vinzi et al., 2010). Similar to f^2 , this three level can be applied to Q^2 as well (Henseler et al., 2009).

Table 5 presents the path coefficients and the significance levels. The direct effects show that self regulated learning has a stronger effect ($\beta = 0.51, p < 0.001$) on course satisfaction than digital literacy ($\beta = 0.24, p < 0.001$). In terms of the influence of course satisfaction on academic performance, the path coefficient shows a significant effect, with $\beta = 0.11, p < 0.01$. Thus, hypothesis 1, hypothesis 2, and hypothesis 3 are supported. Regarding the indirect effect on academic performance through course satisfaction, the coefficient reveals that self-regulated learning ($\beta = 0.05, p < 0.05$) has proven to be important as well as digital literacy ($\beta = 0.03, p < 0.05$) in influencing academic performance of students. Therefore, hypothesis 4 and hypothesis 5 are supported. The calculation of f^2 effect size in Table 5 also shows that the path of self-regulated learning on course satisfaction has a medium effect size, while digital literacy on course satisfaction and course satisfaction on academic performance has a small effect size. The results in Table 5 also indicate that Q^2 effect size of exogenous constructs in the model of this study have an adequate effect size. Self-regulated learning and digital literacy were revealed to have large predictive relevance, while course satisfaction revealed to has a medium effect size.

Table 5. Hypotheses tests and effect size results

Hypotheses	Coefficient	Mean	Standard Deviation	t	Result
H1: Self Regulated Learning -> Course Satisfaction	0.51***	0.51	0.04	12.02	Supported
H2: Digital Literacy -> Course Satisfaction	0.24***	0.24	0.05	4.85	Supported
H3: Course Satisfaction -> Academic Performance	0.11**	0.11	0.04	2.46	Supported
H4: Self Regulated Learning -> Course Satisfaction -> Academic Performance	0.05*	0.06	0.02	2.38	Supported
H5: Digital Literacy -> Course Satisfaction -> Academic Performance	0.03*	0.03	0.01	2.16	Supported
<i>f</i>² effect size					
Self Regulated Learning -> Course Satisfaction	0.27***	0.27	0.06	4.44	Medium
Digital Literacy -> Course Satisfaction	0.06*	0.06	0.03	2.13	Small
Course Satisfaction -> Academic Performance	0.02*	0.02	0.01	1.10	Small
<i>Q</i>² effect size					
Self Regulated Learning	0.46				Large
Digital Literacy	0.45				Large
Course Satisfaction	0.29				Medium
Notes: ***Significant at 0.001 level based on 5,000 bootstraps; **significant at 0.01 level based on 5,000 bootstraps; *significant at 0.05 level based on 5,000 bootstraps					

Discussion and implications

This study aimed to explore how self-regulated learning, digital literacy, and course satisfaction shaped academic performance in online learning settings during the unprecedented COVID-19 pandemic in Indonesia. From the literature review, the authors hypothesized that both self-regulated learning and digital literacy directly affect course satisfaction, while course satisfaction directly influences students' academic performance. Furthermore, self-regulated learning and digital literacy are intervened by course satisfaction in the relationship to students' academic performance.

Our results found that self-regulated learning positively impacts the level of students' course satisfaction. This finding supports the idea of Kuo et al. (2014) that interaction, internet self-efficacy, and self-regulated learning roled as predictors of student satisfaction in online education courses. Furthermore, in Massive Open Online Courses (MOOCs) setting, Li (2019) finding also shows a similar result, that self-regulated learning strategy was a key variable in students' course satisfaction. Also, the empirical evidence in this study found that digital literacy predicted students' course satisfaction. This finding corroborates the ideas of Eshet-Alkalai (2004), who stated that digital literacy is a survival skill in this digital era, including in the learning process. That is why having an understanding of how to use digital tools in the learning process is crucial. Because if students do not have adequate digital literacy, students may experience a tendency to depression in the use of technology, or what is known as technostress, which will surely decrease the academic productivity of university students (Upadhyaya & others, 2021). Another important finding was that course satisfaction positively impacts the students' academic performance. These results match those observed in recent studies. A study conducted by Bossman & Agyei (2022) proved that technology and instructor

dimensions, e-learning satisfaction influence the academic performance of distance students in Ghana.

The mediating effects of course satisfaction proposed in our study suggest that self-regulated learning does not straightforwardly lead to a higher level of academic performance of students, but through course satisfaction. Similar results also applied to digital literacy. These results suggest that nurturing digital literacy and self-regulated learning ignites the students' course satisfaction, which in turn positively affects academic performance. These results support the idea of other scholars that course satisfaction has a crucial role in mediating one variable to another. Take an example of the research conducted by Ko & Chung (2014) that found student satisfaction has a mediating role of teaching quality of teachers and students' academic performance. Furthermore, Nye et al. (2021) also reported similar pattern.

The present results are significant in at least major two respects. First, digital literacy and course satisfaction alone can not directly impact students' academic performance; it needs a high level of student satisfaction at the beginning, so students' academic performance can be fostered. And second, in the time of online learning, self-regulated learning acted as the biggest predictor of the students' academic performance. It means success online learning needs a high level of self-regulated learning from students. Practically speaking, in the community of students with low self-regulated learning, authors are really doubtful that online learning can run smoothly or have the expected outcome.

These findings may help us to understand the online learning situation in Indonesia. The discovery of this study found that digital literacy, while it acted as the second biggest predictor of academic performance, but it still held a high coefficient. It means digital literacy is important. However, as we can notice, Indonesia is a country

with high inequality in many education indicators, let alone socioeconomic status (Ikeda & Echazarra, 2021; OECD, 2018). Imagine, is it possible to have a high level of digital literacy while, in fact, many Indonesian children do not have access to the digital device in their home? Again, we doubt, except the government can guarantee the accessible of the digital devices. In terms of self-regulated learning, this study has important implications for using or developing the teaching strategies that can foster students' self-regulated learning. Dignath et al. (2008) suggest using what is called as self-regulated learning training programs. These programs proved to be effective, even at the primary school level. So the educator needs to realize that self-regulated learning is more likely to be nurture than nature. The educator can not just teach how to understand the subject matter but need to stimulate the self-regulated learning of students.

While COVID-19 is still around, but in Indonesia, the teaching and learning process started to be conducted in schools or campuses. Thus, online learning is no longer fully implemented. Many parties think that online learning should continue to be carried out to reduce the number of transmission and droughts caused by COVID-19. However, this study gives a glimpse that online learning can be successfully implemented, but still with a high level of caution of every stakeholder involved, in order not to let the noble ideals to be achieved actually plunge students into the abyss of ignorance. We need to put what Freire said into heart: "We have methods to approach the content, methods to make us get closer to the learners. Some methods of approaching students can in fact push us very far from the student." (Horton & Freire, 1990).

Key Factors to Foster Academic Performance in Online Learning Environment. An Evidence From Indonesia During COVID-19 Pandemic
Cogent Education

Dear Thamrin,

Your manuscript entitled "Key Factors to Foster Academic Performance in Online Learning Environment. An Evidence From Indonesia During COVID-19 Pandemic", which you submitted to Cogent Education, has now been reviewed.

The reviews, included at the bottom of the letter, indicate that your manuscript could be suitable for publication following revision. We hope that you will consider these suggestions, and revise your manuscript.

Please submit your revision by Dec 04, 2022, if you need additional time then please contact the Editorial Office.

To submit your revised manuscript please go to <https://rp.cogentoa.com/dashboard/> and log in. You will see an option to Revise alongside your submission record.

If you are unsure how to submit your revision, please contact us on OAED-peerreview@journals.tandf.co.uk

You also have the option of including the following with your revised submission:

* public interest statement - a description of your paper of NO MORE THAN 150 words suitable for a non-specialist reader, highlighting/explaining anything which will be of interest to the general public

* about the author - a short summary of NO MORE THAN 150 WORDS, detailing either your own or your group's key research activities, including a note on how the research reported in this paper relates to wider projects or issues.

* photo of the author(s), including details of who is in the photograph - please note that we can only publish one photo

If you require advice on language editing for your manuscript or assistance with arranging translation, please do consider using the Taylor & Francis Editing Services (www.tandfedittingservices.com).

Please ensure that you clearly highlight changes made to your manuscript, as well as submitting a thorough response to reviewers.

We look forward to receiving your revised article.

Best wishes,

Comments to the author

Reviewer 1: This study investigated the predictive role of self-regulated learning (SRL), digital literacy, and course satisfaction on academic performance. It also examined the

mediating role of course satisfaction on the relationships between SRL and digital literacy on academic performance.

The topic under investigation is interesting and relevant to the journal's audience. Generally speaking, the method is rigorous. The findings could contribute to the online learning field. The manuscript is clear and easy to read.

There are some suggestions for the authors to consider for improving the paper.

1. "It required composite reliability and Cronbach's alpha to be above 0.6."

Is there any reference to support this claim? Usually composite reliability and Cronbach's alpha need to be over 0.7. Please provide a reference to justify using 0.6 as the cut-off value.

2. "The self-regulated learning variable uses the Online Self-Regulated Learning Questionnaire (OSLQ) (Barnard et al., 2009)"

The author used Barnard et al.'s OSLQ (2009) to measure SRL. There are six strategies in OSLQ. However, in "Figure 1. Research Model", only five strategies exist. The strategy time management is missing. It is problematic as time management is an important SRL strategy and not many studies in the SRL field missed it.

If the lack of time management is due to the psychometric problems for all time management items, then maybe the author can try to delete those items one by one instead of deleting the whole subscale in one go. So the structure of the construct SRL (i.e., six subscales) can be kept the same as in Barnard et al.'s study (2009) and other SRL studies as much as possible. This way, the study results could be more comparable with prior studies' results.

If the author has already tried this method (i.e., deleting items one by one) and it did not work out, an explanation or justification for the lack of time management need to be provided.

3. In Figure 1, the arrows point from the first-order factors (i.e., the strategies) to the second-order factor (i.e., SRL), which is the opposite of Barnard et al.'s model (2009).

Please see Figure 3 in Barnard et al.'s study (2009). The arrows point from OSRL to its six strategies. Barnard et al.'s model (2009) is reflective-reflective according to Becker et al.'s typology (2012), which is cited in the manuscript. It is weird that the authors used Barnard et al.'s scale (2009) but did not follow their model. Maybe provide a more detailed explanation for "Furthermore, the type of HCMs used in this study is reflective-formative type models (Type II)"?

4. "In the first analysis, the measurement that does not meet the requirements has been removed, namely SRL13, SRL14, SRL15, DL6, DL 7, DL8, DL22, DL23, DL24, and DL25."

We don't know what "SRL13" means.

Table 2 lists the items in codes (e.g., SRL13).

Codes do not help us make sense of the measurements. If it is because the items are too long to be shown in Table 2, how about providing example items in the main text or listing them in an appendix? Whatever way, please help readers get a sense of what exactly the items are measuring.

5. "Therefore, the inner model goodness-of-fit in this study was evaluated following Chin & others (1998), Henseler et al. (2009), and Hair Jr et al. (2016)."

How are Chin & others (1998), Henseler et al. (2009), and Hair Jr et al. (2016) followed?

Although the references are provided, it would be easier for readers to understand the evaluation method if the authors wrote it straight out.

6. "The mediating effects of course satisfaction proposed in our study suggest that self-regulated learning does not straightforwardly lead to a higher level of academic performance of students, but through course satisfaction."

I am curious why SRL did not straightforwardly lead to a higher academic performance since many studies on SRL reported that SRL could directly contribute to academic performance. Has the author tried to examine the direct effect of SRL on academic performance?

7. The research findings are interesting and valuable. The theoretical and practical implications could be further articulated to show the study's value better.

8. "First, digital literacy and course satisfaction alone cannot directly impact students' academic performance; it needs a high level of student satisfaction at the beginning, so students' academic performance can be fostered."

The results actually showed that course satisfaction directly impacts students' academic performance. Please check.

Overall, it is a well-written manuscript. I look forward to reading it again.

Comments to the author

Reviewer 2: The authors have made great efforts to evaluate the key factors, including digital literacy, self-regulated learning, and course satisfaction, that drive student academic performance in an online learning environment in Indonesian higher education. This study reveals the interactions among the related factors and highlights the significance of self-regulated learning and digital literacy in fostering student academic performance in online learning environments. The authors can consider the following points while improving the work:

1. The title: An Evidence from Indonesia during COVID-19 Pandemic.
2. Abstract section: The unprecedented COVID-19 pandemic has changed many aspects of society, including education.
3. Introduction section: "Many aspects have changed..." It is not clear what are these aspects.
4. Introduction section: "Because online learning has powerful characteristics in self-autonomy, self-regulation has an important role in the process." It is confusing how the causality is established.
5. Introduction section: "In the context of learning in regular classrooms, self-regulatory behaviors have been shown to play an important role in students' academic performance (Lan, 1996; Orange, 1999)." This statement needs more elaboration, and the references are out of date.
6. Introduction section: "If this behavior has a vital role in regular classrooms, then it can be expected that self-regulatory skills will play an even much more critical role in

online learning, where students are isolated from each other in their respective rooms." This statement is not solid from the academic perspective.

1. Self-regulated learning section: The meaning of self-regulated learning from Zimmerman (2000), Bandura (1986) and Schunk & Ertmer (2000) should be presented first.
2. Digital Literacy section introduced the concept of digital literacy, while it lacks illustration on why digital literacy is so vital in the 21st century, how will digital literacy be fostered for students, and how will it influence student learning?
3. Course Satisfaction section, "Referring to Rashidi & Moghadam (2014), course satisfaction can be interpreted as the relationship between students' expectations and what they actually get. Therefore, students with high course satisfaction will tend to earn higher grades in their final exam (Puzziferro, 2008)." It is confusing how the causality is established.
4. The front of Table one should be modified.
5. The authors had some reflections in the section of Discussion and implications, maybe some suggestions for the government and educational policymakers can be driven from the survey study.

The manuscript clearly indicates that you have spent a significant amount of time and effort in completing the study. Please refer to the comments given by Reviewer 1 and Reviewer 2 to polish the manuscript. Moreover, you need to better weave in the scholarly insights offered from the literature pieces cited in the literature review when discussing and explaining the findings of the present study. You need to better "synergize" those scholarly works with your new findings to warrant both theoretical and practical contributions to the field and shed light on future research.

In compliance with data protection regulations, you may request that we remove your personal registration details at any time. (Use the following URL: <https://www.editorialmanager.com/cogentedu/login.asp?a=r>). Please contact the publication office if you have any questions.

RESPONSE TO REVIEWERS

Manuscript number: 227363414

Title: Key Factors to Foster Academic Performance in Online Learning Environment: An Evidence From Indonesia During COVID-19 Pandemic

Authors: Thamrin, Reza Aditia, Saidun Hutasuhut

The authors would like to thank the reviewers for their precious time and valuable comments. We have carefully addressed all the comments. The corresponding changes and refinements made in the revised paper are summarized in our response below.

Reviewer 1:

- “It required composite reliability and Cronbach’s alpha to be above 0.6.”
Is there any reference to support this claim? Usually composite reliability and Cronbach’s alpha need to be over 0.7. Please provide a reference to justify using 0.6 as the cut-off value..
Thank you for the advice. Regarding the addition of a reference to justify 0.6 as the cut-off value has been made. Anyway, 0.6. as the cut-off value referring to the suggestion by Hair’s textbook: *A Primer on Partial Least Squares Structural Equation Modeling*, which is widely used as a guide in using PLS-SEM analysis. The part that has changed can be seen in the comments section addressed to reviewer 1.

- “The self-regulated learning variable uses the Online Self-Regulated Learning Questionnaire (OSLQ) (Barnard et al., 2009)”
The author used Barnard et al.’s OSLQ (2009) to measure SRL. There are six strategies in OSLQ. However, in “Figure 1. Research Model”, only five strategies exist. The strategy time management is missing. It is problematic as time management is an important SRL strategy and not many studies in the SRL field missed it.
If the lack of time management is due to the psychometric problems for all time management items, then maybe the author can try to delete those items one by one instead of deleting the whole subscale in one go. So the structure of the construct SRL (i.e., six subscales) can be kept the same as in Barnard et al.’s study (2009) and other SRL studies as much as possible. This way, the study results could be more comparable with prior studies’ results.
If the author has already tried this method (i.e., deleting items one by one) and it did not work out, an explanation or justification for the lack of time management need to be provided.
Thank you for pointing this out! I agree with you that SRL has six sub-constructs, namely: goal setting, environment structuring, task strategies, time management, help-seeking, and self-evaluation. However, after the initial run, the convergent validity and internal consistency reliability of this sub-construct were not so good, if not bad. In the evaluation of measurement models for first-order constructs explanation, you can see in the second paragraph that SRL12, SRL 13, and SRL 15 have been removed. These were the time management items, actually. It was my fault because I didn’t give a clear explanation. The more clear reason has been made to hinder any misunderstanding. The parts that had changed can be seen in the comments section addressed to reviewer 1.

- In Figure 1, the arrows point from the first-order factors (i.e., the strategies) to the second-order factor (i.e., SRL), which is the opposite of Barnard et al.'s model (2009). Please see Figure 3 in Barnard et al.'s study (2009). The arrows point from OSRL to its six strategies. Barnard et al.'s model (2009) is reflective-reflective according to Becker et al.'s typology (2012), which is cited in the manuscript. It is weird that the authors used Barnard et al.'s scale (2009) but did not follow their model. Maybe provide a more detailed explanation for "Furthermore, the type of HCMs used in this study is reflective-formative type models (Type II)"?

I appreciate your concern. However, as we can see in the data analysis procedure, I used reflective-formative type models (type II). This was for the sake of practical reasons since a study by Becker et al. (2012) has pointed out that this approach produces generally less biased, and therefore, more precise parameter estimates and a more reliable higher-order construct score. Furthermore, Hair himself said in his textbook: "When do we measure a construct reflectively or formatively? There is not a definite answer to this question since constructs are not inherently reflective or formative. Instead, the specification depends on the construct conceptualization and the objective of the study" (Hair Jr et al., 2016). hope you understand.

- "In the first analysis, the measurement that does not meet the requirements has been removed, namely SRL13, SRL14, SRL15, DL6, DL 7, DL8, DL22, DL23, DL24, and DL25."

We don't know what "SRL13" means. Table 2 lists the items in codes (e.g., SRL13). Codes do not help us make sense of the measurements. If it is because the items are too long to be shown in Table 2, how about providing example items in the main text or listing them in an appendix? Whatever way, please help readers get a sense of what exactly the items are measuring

Thank you for your advice, the appendix has been added,

- "Therefore, the inner model goodness-of-fit in this study was evaluated following Chin & others (1998), Henseler et al. (2009), and Hair Jr et al. (2016)."

How are Chin & others (1998), Henseler et al. (2009), and Hair Jr et al. (2016) followed? Although the references are provided, it would be easier for readers to understand the evaluation method if the authors wrote it straight out

The authors would like to thank reviewer 1 for the valuable advice. The explanation regarding the recommendation of Chin & others (1998), Henseler et al. (2009), and Hair Jr et al. (2016) that the authors followed has been added

- "The mediating effects of course satisfaction proposed in our study suggest that self-regulated learning does not straightforwardly lead to a higher level of academic performance of students, but through course satisfaction."

I am curious why SRL did not straightforwardly lead to a higher academic performance since many studies on SRL reported that SRL could directly contribute to academic performance. Has the author tried to examine the direct effect of SRL on academic performance?

I appreciate your concern. However, this is the novelty we proposed that other previous studies have not yet examined. We hope this finding makes the stakeholder not limit the effort in fostering performance solely by SRL but also consider course satisfaction as

well, since SRL has been found to mediate these two variables. The authors did not try to examine the direct effect of SRL on academic performance because this is beyond the scope of this study, not to mention that there was no novel finding from it. As you said, there are already many studies about the direct effect of SRL on academic performance. I hope you understand and appreciate this novel finding.

- The research findings are interesting and valuable. The theoretical and practical implications could be further articulated to show the study's value better.
The authors would like to thank reviewer 1 for the comment and the advice. The additions in the discussion section have been made.
- “First, digital literacy and course satisfaction alone cannot directly impact students' academic performance; it needs a high level of student satisfaction at the beginning, so students' academic performance can be fostered.”
The results actually showed that course satisfaction directly impacts students' academic performance. Please check.
I appreciate your concern. I have changed the phrase to hinder misunderstanding.

Reviewer 2:

- The title: An Evidence from Indonesia during COVID-19 Pandemic.
I really thank the reviewer 2 for this valuable suggestion. The suggestion has been accommodated.
- Abstract section: The unprecedented COVID-19 pandemic has changed many aspects of society, including education.
Again, thank you for reviewer 2 advice. The suggestion has been accommodated.
- Introduction section: “Many aspects have changed...” It is not clear what are these aspects
The explanation about the aspect (that is society) has been added. The further explanation can be seen in the next phrase: “Numerous things are becoming the new norm today, such as people being required to wear masks when in public spaces, places usually used as gathering places being limited...”.
- Introduction section: “Because online learning has powerful characteristics in self-autonomy, self-regulation has an important role in the process.” It is confusing how the causality is established.
I appreciate your concern. Please kindly refer to the previous sentences: [The application of a learning management system (LMS) in online learning is challenging. This challenge comes from two sources. Firstly, it is caused by the physical absence of lecturers, and secondly is caused by the loss of the campus academic atmosphere, so that students tend to use their productive time to do other things besides studying (Elders et al., 2003; Levy & Ramim, 2012; Michinov et al., 2011)]. I think the causality is quite clear already.

- Introduction section: “In the context of learning in regular classrooms, self-regulatory behaviors have been shown to play an important role in students' academic performance (Lan, 1996; Orange, 1999).” This statement needs more elaboration, and the references are out of date.
I really thank reviewer 2 for this valuable suggestion. The suggestion has been accommodated
- Introduction section: “If this behavior has a vital role in regular classrooms, then it can be expected that self-regulatory skills will play an even much more critical role in online learning, where students are isolated from each other in their respective rooms.” This statement is not solid from the academic perspective.
I appreciate your concern. To hinder misunderstanding and give my statement a solid academic base, I have referred to a study by Hong et al. (2021).
- Self-regulated learning section: The meaning of self-regulated learning from Zimmerman (2000), Bandura (1986) and Schunk & Ertmer (2000) should be presented first.
I really thank reviewer 2 for this valuable suggestion. The suggestion has been accommodated
- Digital Literacy section introduced the concept of digital literacy, while it lacks illustration on why digital literacy is so vital in the 21st century, how will digital literacy be fostered for students, and how will it influence student learning?
Thank you for reviewer 2 advice. The suggestion has been accommodated
- Course Satisfaction section, “Referring to Rashidi & Moghadam (2014), course satisfaction can be interpreted as the relationship between students' expectations and what they actually get. Therefore, students with high course satisfaction will tend to earn higher grades in their final exam (Puzziferro, 2008).” It is confusing how the causality is established
Thank you for pointing this out. This was purely our fault. We should not used “therefore” from the beginning. We have deleted the “therefore” word.
- The front of Table one should be modified.
We are sorry, we do not understand about what reviewer 2 means by front of table? If reviewer 2 means is font, we have modified it.
- The authors had some reflections in the section of Discussion and implications, maybe some suggestions for the government and educational policymakers can be driven from the survey study.
We would like to thank reviewer 2 for the advice. The additions regarding the suggestions for the government and educational policymakers have been made in the discussion section

Key Factors to Foster Academic Performance in Online Learning Environment: Evidence From Indonesia During COVID-19 Pandemic

Thamrin¹, Reza Aditia², Saidun Hutasuhut³

^{1,3}Faculty of Economics, Universitas Negeri Medan, Indonesia

²Faculty of Teacher Training and Education, Universitas Muhammadiyah Sumatera Utara, Indonesia

The unprecedented COVID-19 pandemic has changed many aspects of society, including education. While online learning aims to avoid the transmission of viruses, however, what causes the success or failure of online learning needs to be investigated. This study tries to answer the question by analyzing how self-regulated learning, digital literacy, and the mediation of course satisfaction influence students' academic performance in online learning situations caused by the COVID-19 pandemic in Indonesia. We employed Partial Least Square Structural Equation Modelling (PLS-SEM) on 358 respondents gathered from an online survey questionnaire completed by undergraduate students during the pandemic. The study finds that self-regulated learning is the key factor, followed by digital literacy. Course satisfaction also proved to mediate self-regulated learning and digital literacy on academic performance.

Keywords: Indonesia; PLS-SEM; online learning; self-regulated learning; digital literacy

Introduction

It has been two years since the COVID-19 pandemic was officially declared to have entered Indonesian territory. Many aspects of society have changed caused by social distancing, from partial until full lockdowns. Numerous things are becoming the new norm today, such as people being required to wear masks when in public spaces, places usually used as gathering places being limited in capacity and operating hours, and places of worship have been temporarily closed. Among them, the most striking thing since the pandemic is that teaching and learning activities in schools and campuses are not allowed and replaced with online learning, not only in Indonesia but school closure is also implemented throughout the global level. Following UNESCO recommendations, educational institutions are encouraged to replace the face-to-face learning process with online learning (Crawford et al., 2020).

The application of a learning management system (LMS) in online learning is challenging. This challenge comes from two sources. Firstly, it is caused by the physical absence of lecturers, and secondly is caused by the loss of the campus academic atmosphere, so that students tend to use their productive time to do other things besides studying (Elvers et al., 2003; Levy & Ramim, 2012; Michinov et al., 2011). Because online learning has powerful characteristics in self-autonomy, self-regulation has an important role in the process. If we reflect in the context of learning in regular classrooms, self-regulatory behaviors have been shown to play an important role in

students' academic performance (Gonzalez-Nucamendi et al., 2021; Lan, 1996; Orange, 1999; Perry et al., 2012). If this behavior has a vital role in regular classrooms, then it can be expected that self-regulatory skills will play an even much more critical role in online learning, where students are isolated from each other in their respective rooms, because the lack of self-regulation can lead students to negative traits, such as procrastination (Hong et al., 2021). Students who lack self-regulatory learning skills are suspected of manipulating their self-autonomy so that the learning tasks they should have completed in online courses are unfinished.

In addition to self-regulated learning, the ability to use digital devices, or known as digital literacy also plays an important role here. This is because online learning is not only about using devices to access the LMS, but also how to synthesize information and prevent risks that may occur when accessing the internet (Rodríguez-de-Dios & Igartua, 2016). If the understanding of literacy in the past meant demonstrating the capacity to extract sense from what they read (Prior et al., 2016), then digital literacy also has similar characteristics, because the skill to read and to write was not enough to identify a person as being literate (Miranda et al., 2018). A person can be said to have digital literacy if they have the ability to understand and use various information that they obtained from a variety of digital sources (Gilster, 1997).

Researchers have revealed that self-regulated learning influences students' course satisfaction (Kuo et al., 2014; Puzifferro, 2008; Wang et al., 2013). If explored further, course satisfaction is known to have implications for student academic performance (Blanz, 2014; Topalá, 2014). Also, based on the previous study, self-regulated learning and digital literacy are known to influence academic performance directly, but previous research has only focused more on the regular classroom setting (Bail et al., 2008; Leung & Lee, 2012; Lucieer et al., 2016; Vrana, 2014). However, as far as the authors know, there is no study about how digital literacy influences course satisfaction in the online learning environment, even though in the online learning process the use of digital devices is absolutely necessary. Regarding how course satisfaction in mediating digital literacy and self-regulated learning on academic performance also has never been studied before. Thus, this study aims to fill these gaps by investigating them. Again, this study becomes important because it captures a broader understanding of how self-regulated learning, digital literacy, and course satisfaction influence students' academic performance in online learning situations caused by the unprecedented COVID-19 pandemic in Indonesia.

Theoretical background and hypothesis development

Self-regulated learning

According to Zimmerman (2000), self-regulation is defined as self-generated thoughts, feelings, and actions that are planned and cyclically adjusted to achieve personal goals. Meanwhile, Bandura (1986) states that self-regulated learning represents the relationship between triadic processes, namely personal, behavior and environment. Furthermore, when referring to Schunk & Ertmer (2000), self-regulation is a cycle when personal, environmental, and behavioral aspects experience changes during the learning process. In online learning, students have complete control over their learning. Thus, they must do things independently related to their learning, including planning,

regulating, monitoring, and evaluating. Successful self-regulated learning is characterized by active engagement, adjustment, and readjustment of learning strategies according to various factors they met.

Furthermore, even though students who carry out online learning need to be independent and autonomous, they are also expected to be able to carry out self-management. Self-regulated learning has much in common with learners' ability to exert self-control. Previous literature has shown that aspects such as resisting temptation, resisting distractions, focusing on long-term goals, and delaying short-term gratification are all part of self-regulation (Zhu et al., 2016). However, this is not easy to maintain (Elvers et al., 2003; Levy & Ramim, 2012; Michinov et al., 2011). Previous literature states that self-regulation in online learning settings tends to create learning difficulties for students compared to face-to-face learning (Lajoie & Azevedo, 2006; Lee et al., 2008; Samruayruen et al., 2013; Tsai & Tsai, 2010). Furthermore, if not managed properly, an unorganized profile from the aspect of self-regulated learning is associated with poor academic outcomes, such as a low GPA of students (Barnard et al., 2009).

Digital Literacy

The concept of digital literacy has changed in recent years, and even this term is often confused, as there is no general consensus among academics on its definition (Bawden, 2001, 2008; Hockly, 2012). Initially, this term expressly referred to knowledge of hardware and software. Thus, people are considered to have digital literacy if they know how to use a word processing application such as Microsoft Word. Furthermore, along with the advancement of internet technology, until around the 1990s, some academics used this term to refer to the ability to read and understand the hypertextual text and multimedia (Bawden, 2001). Nevertheless, this concept is seen as more than just using the software or the device itself. Therefore, it relates to expertise and skills in the use of mechanics as well as knowledge and skills about using these devices for different purposes (Chisholm, 2006). The importance of technology is seen not merely from the capacity to use technology but also from the intellectual, social, and ethical aspects. This is when the concept of digital literacy must take into account. It is relevant in today's class setting, while education does depend on technological use, even since primary school (Buckingham, 2015; Casey & Bruce, 2011; Unsworth, 2005). At juvenile and adult levels, digital literacy becomes a vital capacity in mastering not only for the sake of daily tasks and daily routines but also in all sectors of society, including in higher education and the professional world (Ahmed & Roche, 2021; Mohammadyari & Singh, 2015; Siddiq et al., 2017). If students have excellent digital literacy skills and, as a consequence, they know how to use technology, it will bring them several benefits for their learning because technology gives students easy access to academic resources, makes them more productive, feel connected, with more immersive, engaging, and relevant experience (Burton et al., 2015).

Digital literacy can be interpreted as an individual's awareness, attitude, and ability to use digital tools and facilities appropriately to identify, access, manage, integrate, evaluate, analyze and synthesize digital resources, build new knowledge, create media expressions, and communicate with others, in the context of specific life situations, to enable constructive social action, and for reflection (Hockly, 2012; Martin, 2005).

Although today's generation is digital natives (Al-htaybat et al., 2018) and they are at the forefront of new technologies, it is not a guarantee that they will be able to use them wisely because today's generation has many difficulties managing information, assessing the credibility of information, building their digital identity, and manage privacy in their online activities (Fernández-Villavicencio, 2012). Furthermore, referring to Rodríguez-de-Dios & Igartua (2016), there are five dimensions of digital literacy, namely:

- Technological or Instrumental Skill
- Communication Skill
- Information Skill
- Critical Skill
- Security Skill

Course Satisfaction

Concerning terminology about satisfaction in education, it is often referred to by different names, such as student satisfaction (Xiao & Wilkins, 2015), learning satisfaction (Topala & Tomozii, 2014), and course satisfaction (Frey et al., 2003; Wang et al., 2013). However, this study uses the term of course satisfaction. In most countries, students are required to pay tuition fees, then, like consumers in business sector, their satisfaction needs to be considered by universities (Xiao & Wilkins, 2015). Referring to Rashidi & Moghadam (2014), course satisfaction can be interpreted as the relationship between students' expectations and what they actually get. Previous study has proven that students with high course satisfaction will tend to earn higher grades on their final exam (Puzziferro, 2008).

This can be imperative in online learning. With the limited interaction and many potential disruptions, course satisfaction can be in jeopardy (Dong et al., 2020; Watermeyer et al., 2022), while a large body of evidence proves that course satisfaction plays a significant role in academic performance (Abuhassna et al., 2020; Blanz, 2014; Hanus & Fox, 2015; Ko & Chung, 2014). Hence, the success of online learning can be achieved when students are satisfied with their learning experience (course satisfaction), and consequently, they will have satisfying academic performance (Chang & Smith, 2008; Marks et al., 2005; Puzziferro, 2008).

Based on the theoretical grounding and previous findings, we propose five hypotheses as follows:

- H1: Self-regulated learning has a significant positive direct effect on course satisfaction
- H2: Digital literacy has a significant positive direct effect on course satisfaction
- H3: Course satisfaction has a significant positive direct effect on academic performance
- H4: Course satisfaction mediates the relationship between self-regulated learning and academic performance

H5: Course satisfaction mediates the relationship between digital literacy and academic performance

Research Model

The model proposed in this study can be seen in figure 1, which generated by the theoretical grounding and hypotheses postulated. In this model, self-regulated learning and digital literacy act as an exogenous latent variable. Meanwhile, the course satisfaction variable acts as an endogenous latent variable with a dual relationship as both independent and dependent, and the academic performance variable acts as an endogenous latent variable.

Method

Research design and sample

This study used survey research design as its research procedure. Survey research designs are methods in quantitative research in which researchers administer a survey to a sample or to the entire population of people to describe the attitudes, opinions, behaviors, or characteristics of the population (Creswell, 2012). Furthermore, the type of survey research design used is cross-sectional survey designs, where data is collected at one point in time (Creswell, 2012). In this study, the sample was selected using convenience sampling procedure. In determining the sample size, the authors followed the recommendations given by Hair Jr et al. (2016), where to determine the required number of samples, it should be in line with the statistical power. To calculate the required sample size and the statistical power, the authors utilized G*Power software (Faul et al., 2007). The authors used error measurements of type one and two at $\alpha = 0.05$ and power $(1 - \beta) = 0.95$, while the effect size = 0.15 to achieve medium effect size as the minimum threshold (Cohen, 2013; Hair Jr et al., 2016). The number of predictors as the model offered by the researcher are 3 predictors, with 2 number of tested predictors. The calculation shows that the minimum sample required in this study is 107. Furthermore, the complete settings authors used to analyze the sample size and the results can be seen in Figure 2. The sample consisted of undergraduate students who studied in two universities in Indonesia.

Instrumentation and data collection

The instruments used in data collection in this study have been validated by previous research. The self-regulated learning variable uses the Online Self-Regulated Learning Questionnaire (OSLQ) (Barnard et al., 2009), the digital literacy variable uses an instrument developed by Rodriguez-de-Dios et al. (2016). Meanwhile, the learning satisfaction variable was adopted from the Course Satisfaction Questionnaire (CSQ) instrument (Frey et al., 2003), and academic performance using an instrument that has been validated by Nayak (2018). All variables were measured by utilizing five points Likert scale, where 1 refers to 'strongly disagree' and 5 refers to 'strongly agree'.

In data collection, authors conducted a web-base survey among Indonesian students. The number of completed questionnaires was 358, where this sample size fulfilled the minimum sample calculated using the G*Power application (107 sample size).

Sample demographic background

Table 1 shows the background of the sample who participated in this study. The categories of all samples (n = 358) are divided into gender, university, and the most frequent devices used in online learning. More than half were female (69.55%), and the remaining were male (30.45%). In terms of universities, the number of samples from the two universities was still relatively comparable in size, with 201 samples from Universitas Negeri Medan (56.15%), while those from Universitas Islam Negeri Sumatera Utara were 157 (43.85%). Interestingly, based on the devices used in attending online lectures, the majority of the samples participating in this study used mobile phones in online learning, with a total of 300 (83.8%), and the remaining using laptops (16.2%).

Table 1. Sample demographic background

		Frequency	Percentage
Gender	Male	109	30.45
	Female	249	69.55
University	Universitas Negeri Medan	201	56.15
	Universitas Islam Negeri Sumatera Utara	157	43.85
The most frequent devices used	Laptop	58	16.20
	Handphone	300	83.80

Data analysis procedure

Because the constructs authors want to examine are complex and contain two layers of constructs thus, the hierarchical component models (HCMs) in Partial Least Square Structural Equation Modeling (PLS-SEM) were employed for data analysis. HCMs have two elements: the higher-order component (HOC), which captures the more abstract higher-order entity, and the lower-order components (LOCs), which capture the subdimensions of the higher-order entity (Hair Jr et al., 2016). Furthermore, the type of HCMs used in this study is reflective-formative type models (Type II). Regarding the approach to estimate the HCMs, there are three approaches to estimate the parameters in HCMs models using PLS-SEM, they are the repeated indicator approach (Lohmöller, 2013; Wold, 1982), the two-stage or sequential approach (Ringle et al., 2012; Wetzels et al., 2009), and the hybrid approach (Becker et al., 2012; Ciavolino & Nitti, 2013). However, authors used repeated indicator with Mode B formative measurement to estimate the parameters in HCMs in this study. The advantage of the repeated indicator approach is its capability to assess all constructs simultaneously instead of assessing lower-order and higher-order dimensions separately (Becker et al., 2012). Mode B for

the repeated indicator also considers to more appropriate referring to Becker et al. (2012).

In general, PLS-SEM chosen with the reason of the nature of this research is exploratory and predictive (Hair Jr et al., 2016; Henseler et al., 2016). In addition, the utilization of PLS-SEM is also preferred because it allows researchers to approximate complex models with many constructs, indicators, and structural paths without having to worry about distributional assumptions on research data since PLS-SEM is non-parametric in nature (Hair Jr et al., 2016). Three main steps were conducted in analyzing the results: (1) evaluation of measurement models for first-order constructs, (2) evaluation of the first-order constructs on the second-order constructs, (3) evaluation of the structural model (Becker et al., 2012; Hair Jr et al., 2016; Ringle et al., 2015). The explanation for both evaluations will be explained in the next session.

Results

Evaluation of measurement models for first-order constructs

The first-order constructs in this study have reflective constructs. The assessment of reflective constructs involves convergent validity, internal consistency reliability, and discriminant validity (Hair Jr et al., 2016). Convergent validity is the degree to which a measure correlates with other measures of the same construct (Hair Jr et al., 2016) requiring both loading factors and Average Variance Extracted (AVE) to exceed 0.5. Furthermore, internal consistency reliability is a form of reliability used to determine whether the items measuring a construct are similar in their scores. It required composite reliability and Cronbach's alpha to be above 0.6 (Hair Jr et al., 2016). The last aspect in evaluating the measurement models for first-order constructs is discriminant validity. While there are many approaches to evaluating the discriminant

validity, such as cross-loading (Henseler et al., 2009), Fornell-Larcker criterion (Fornell & Larcker, 1981), and Heterotrait-monotrait ratio (HTMT) (Henseler et al., 2015). HTMT is considered to have a more accurate examination since cross loading and Fornell-Larcker criterion suffer to recognize discriminant validity issues (Henseler et al., 2015). For the threshold, the HTMT confidence interval must not include 1. For a more conservative threshold, 0.85 seems warranted (Henseler et al., 2015).

However, the results shown in Table 2 are the second run analysis. In the first analysis, the measurement that does not meet the requirements has been removed, namely SRL13, SRL14, SRL15, DL6, DL 7, DL8, DL22, DL23, DL24, and DL25. SRL13, SRL14 and SRL15 were parts of Time Management sub-construct from Self-Regulated Learning. DL6 and DL7 were parts of Technological Skill sub-construct from Digital Literacy. DL8 was one of the Personal Security Skill sub-construct from Digital Literacy. While DL22, DL23, DL24, and DL25 were parts of Information Skill sub-construct from digital literacy. Therefore, two sub-constructs were discarded completely: Time Management from Self-Regulated Learning, and Information Skill from Digital Literacy. Table 2 shows that all constructs have adequate convergent validity, internal consistency reliability, and discriminant validity. Nonetheless, the details of HTMT results can be seen in Table 3. Once it is confirmed that the evaluation of measurement models for first-order constructs is viable, then it can proceed to the evaluation of the second-order constructs.

Evaluation of the first-order constructs on the second-order constructs

The evaluation of the second order follows the same process or analogy used to evaluate the first order constructs (Chin, 1998). However, since the second order is formative, several researchers have emphasized that traditional validity assessments do not apply like its reflective counterpart (Götz et al., 2010; Hair Jr et al., 2016; Henseler et al., 2009; Petter et al., 2007). Fundamentally, formative models assume that the indicators have an influence or shape the construct (Hair Jr et al., 2016; Jarvis et al., 2003). It makes a different interpretation and evaluation of the measurement (Götz et al., 2010; Hair Jr et al., 2016). Thus, in general, the evaluation of the second-order constructs contains two steps: the indicator level (in which the first-order constructs now act as indicators), and the second-order constructs (Henseler et al., 2009).

In the first stage, we need to assess whether every first-order construct contributes to forming the second-order construct (Chin, 1998; Hair et al., 2011). However, as a reminder, we treated the path as weights instead of loading factor. Note that the weights obtained are the scores we obtained in the first stage. Referring to Andreev et al. (2009), the indicators' weight should exceed 0.1. Furthermore, bootstrapping should be employed to verify the significance (Hair et al., 2011; Henseler et al., 2009). Table 4 shows that all first-order constructs' weights are higher than 0.10 and have a significant level based on 5,000 bootstrapping, which means there is empirical support for the first-order constructs in terms of the construction of the formative second-order constructs (Hair et al., 2011).

Furthermore, it is necessary to assess the nomological validity at the second-order construct level. This validity manifested in the magnitude and significance of the relationships between the second-order formative construct with the other constructs in the model (Henseler et al., 2009). The results in Table 5 indicate a significant relationship between second-order formative constructs in this study and other constructs in the model. It means the nomological validity has been met.

Table 4. Weights of the first order constructs on the second-order constructs

Construct level		Weight	t	Mean	Standard Deviation
Second-order construct	First-order construct				
Self regulated learning	Goal setting	0.29	29.13***	0.29	0.01
	Environment structuring	0.19	22.97***	0.19	0.01
	Task strategies	0.26	36.34***	0.26	0.01

	Help-seeking	0.25	29.44***	0.25	0.01
	Self-evaluation	0.21	34.55***	0.21	0.01

	Personal security skill	0.21	27.05***	0.21	0.01
	Critical skill	0.32	36.71***	0.32	0.01
	Device security skill	0.24	28.30***	0.24	0.01
	Communication skill	0.16	23.90***	0.16	0.01

Notes: *Significant at 0.001 level based on 5,000 bootstraps; **significant at 0.01 level based on 5,000 bootstraps; *significant at 0.05 level based on 5,000 bootstraps**

Evaluation of the structural model (inner model)

After the outer model is proven to be reliable and valid, then the inner model estimates should be examined for the sake of hypothesized relationships among constructs in the model (Hair et al., 2012; Hair Jr et al., 2016). However, PLS-SEM is different from CB-SEM. It makes the goodness-of-fit of CB-SEM not fully transferrable to PLS-SEM. Therefore, the inner model goodness-of-fit in this study was evaluated following Chin & others (1998), Henseler et al. (2009), and Hair Jr et al. (2016) by assessing the f^2 and Q^2 effect size. Furthermore, the standardized path coefficients and significance levels with 5,000 bootstrapping allow researchers to test the proposed hypotheses.

Many researchers rely on R2 to examine the explained variance of the endogenous constructs. However, since the second-order constructs in the model of this study use repeated indicators, surely the variance of the second-order construct will be perfectly explained, and the explained variance will be equal to 1. Therefore, another approach is used, known as the Stone-Geisser's Q^2 (Geisser, 1975; Stone, 1974). In the PLS-SEM application, this approach follows a blindfolding procedure and then tries to estimate the omitted part using the estimated parameters (Vinzi et al., 2010). In this study, researchers used SmartPLS blindfolding feature with the omission distance used was 7. This value follows the recommendation by Chin (1998) and Henseler et al. (2012) that omission distance should be between 5 and 10. For interpretation, if $Q^2 > 0$, it means the model has predictive relevance. However, if $Q^2 < 0$ it represents a lack of predictive relevance (Henseler et al., 2009; Vinzi et al., 2010).

Besides Q^2 , numerous scholars (Hair Jr et al., 2016; Henseler et al., 2009; Ringle et al., 2020) also recommended evaluating the effect size of each path using f^2 (Cohen's effect size) (Cohen, 2013). Values between 0.02 and 0.15, between 0.15 and 0.35, and over 0.35 represents small, medium, and large effect size, respectively (Henseler et al., 2012; Vinzi et al., 2010). Similar to f^2 , this three level can be applied to Q^2 as well (Henseler et al., 2009).

Table 5 presents the path coefficients and the significance levels. The direct effects show that self regulated learning has a stronger effect ($\beta = 0.51$, $p < 0.001$) on course satisfaction than digital literacy ($\beta = 0.24$, $p < 0.001$). In terms of the influence of course satisfaction on academic performance, the path coefficient shows a significant effect, with $\beta = 0.11$, $p < 0.01$. Thus, hypothesis 1, hypothesis 2, and hypothesis 3 are supported. Regarding the indirect effect on academic performance through course satisfaction, the coefficient reveals that self-regulated learning ($\beta = 0.05$, $p < 0.05$) has proven to be important as well as digital literacy ($\beta = 0.03$, $p < 0.05$) in influencing academic performance of students. Therefore, hypothesis 4 and hypothesis 5 are supported. The calculation of f^2 effect size in Table 5 also shows that the path of self-regulated learning on course satisfaction has a medium effect size, while digital literacy on course satisfaction and course satisfaction on academic performance has a small effect size. The results in Table 5 also indicate that Q^2 effect size of exogenous constructs in the model of this study have an adequate effect size. Self-regulated learning and digital literacy were revealed to have large predictive relevance, while course satisfaction revealed to has a medium effect size.

Table 5. Hypotheses tests and effect size results

Hypotheses	Coefficient	Mean	Standard Deviation	t	Result
H1: Self Regulated Learning -> Course Satisfaction	0.51***	0.51	0.04	12.02	Supported

Discussion and implications

This study aimed to explore how self-regulated learning, digital literacy, and course satisfaction shaped academic performance in online learning settings during the unprecedented COVID-19 pandemic in Indonesia. From the literature review, the authors hypothesized that both self-regulated learning and digital literacy directly affect course satisfaction, while course satisfaction directly influences students' academic performance. Furthermore, self-regulated learning and digital literacy are intervened by course satisfaction in the relationship to students' academic performance.

Our results found that self-regulated learning positively impacts the level of students' course satisfaction. This finding supports the idea of Kuo et al. (2014) that interaction, internet self-efficacy, and self-regulated learning roled as predictors of student satisfaction in online education courses. Furthermore, in Massive Open Online Courses (MOOCs) setting, Li (2019) finding also shows a similar result, that self-regulated learning strategy was a key variable in students' course satisfaction. Also, the empirical evidence in this study found that digital literacy predicted students' course satisfaction. This finding corroborates the ideas of Eshet-Alkalai (2004), who stated that digital literacy is a survival skill in this digital era, including in the learning process. That is why having an understanding of how to use digital tools in the learning process is crucial. Because if students do not have adequate digital literacy, students may experience a tendency to depression in the use of technology, or what is known as technostress, which will surely decrease the academic productivity of university students (Upadhyaya & others, 2021). Another important finding was that course satisfaction positively impacts the students' academic performance. These results match those observed in recent studies. A study conducted by Bossman & Agyei (2022) proved that technology and instructor dimensions, e-learning satisfaction influence the academic performance of distance students in Ghana.

The mediating effects of course satisfaction proposed in our study suggest that self-regulated learning does not straightforwardly lead to a higher level of academic performance of students, but through course satisfaction. Similar results also applied to digital literacy. These results suggest that nurturing digital literacy and self-regulated learning ignites the students' course satisfaction, which in turn positively affects academic performance. These results support the idea of other scholars that course satisfaction has a crucial role in mediating one variable to another. Take an example of the research conducted by Ko & Chung (2014) that found student satisfaction has a mediating role of teaching quality of teachers and students' academic performance. Furthermore, Nye et al. (2021) also reported similar pattern.

The present results are significant in at least two major aspects. First, in the sample and setting in this study, digital literacy and course satisfaction do not only act as a stand-alone variable that impacts students' academic performance; it also needs a high level of student satisfaction at the prior, so that students' academic performance can be fostered. And second, in the time of online learning, self-regulated learning acted as the biggest predictor of the students' academic performance. It means success online learning needs a high level of self-regulated learning from students. Practically speaking, in the

community of students with low self-regulated learning, authors are really doubtful that online learning can run smoothly or have the expected outcome.

These findings may help us to understand the online learning situation in Indonesia. The discovery of this study found that digital literacy, while it acted as the second biggest predictor of academic performance, but it still held a high coefficient. It means digital literacy is important. However, as we can notice, Indonesia is a country with high inequality in many education indicators, let alone socioeconomic status (Ikeda & Echazarra, 2021; OECD, 2018). Imagine, is it possible to have a high level of digital literacy while, in fact, many Indonesian children do not have access to the digital device in their home? Again, we doubt, except the government can guarantee the accessible of the digital devices. In terms of self-regulated learning, this study has important implications for using or developing the teaching strategies that can foster students' self-regulated learning. Dignath et al. (2008) suggest using what is called as self-regulated learning training programs. These programs proved to be effective, even at the primary school level. So the educator needs to realize that self-regulated learning is more likely to be nurture than nature. The educator can not just teach how to understand the subject matter but need to stimulate the self-regulated learning of students.

While COVID-19 is still around, but in Indonesia, the teaching and learning process started to be conducted in schools or campuses. Thus, online learning is no longer fully implemented. Many parties think that online learning should continue to be carried out to reduce the number of transmission and droughts caused by COVID-19. However, this study gives a glimpse that online learning can be successfully implemented, but still with a high level of caution of every stakeholder involved, in order not to let the noble ideals to be achieved actually plunge students into the abyss of ignorance. This study suggests that the government and educational policymakers move the learning process from the "virtual world" to the actual classroom as soon as possible, especially in Indonesia, where online learning readiness is not too good (Afrianti & Aditia, 2020). If online learning really needs to be conducted, blended learning platform is preferable to fully online learning because blended learning combines the benefit of both worlds (Dziuban et al., 2018), but still, the implementation needs an enormous amount of caution. As the finding from this study indicates, academic performance in an online environment really depends on digital literacy capacity. If the students cannot use the digital device well, do not rely on technological devices to deliver your learning.

As a closing statement to hinder us from doing malpractice in education, we need to put what the distinguished scholar in pedagogy, Paulo Freire, said into heart: "We have methods to approach the content, methods to make us get closer to the learners. Some methods of approaching students can in fact push us very far from the student." (Horton & Freire, 1990).

Dear Thamrin Thamrin,

Thank you for submitting your revised manuscript.

Submission ID	227363414
Manuscript Title	Key Factors to Foster Academic Performance in Online Learning Environment: Evidence From Indonesia During COVID-19 Pandemic
Journal	Cogent Education

You can check the progress of your submission, and make any requested revisions, on the Author Portal.

Thank you for submitting your work to our journal.
If you have any queries, please get in touch with OAED-peerreview@journals.tandf.co.uk.

Kind Regards,
Cogent Education Editorial Office

RESPONSE TO REVIEWERS (2nd Round)

Manuscript number: 227363414

Title: Key Factors to Foster Academic Performance in Online Learning Environment: Evidence From Indonesia During COVID-19 Pandemic

The authors would like to thank the reviewers for their precious time and valuable comments in the second round of review. We have carefully addressed all the comments. The corresponding changes and refinements made in the revised paper are summarized in our response below.

Reviewer 1:

- Theoretical background and hypothesis development: "...course satisfaction can be interpreted as the relationship between students' expectations and what they actually get. Therefore, students with high course satisfaction will tend to earn higher grades in their final exam."
The logic flow here seems to be not very easy to follow. Is it possible that students with higher grades in their final exam show more course satisfaction, and a good grade could be a reason for course satisfaction? It would be more helpful if the authors elaborated more on the rationality of the hypothesis that course satisfaction has a significant positive direct effect on academic performance (i.e., H3).
The authors would like to thank reviewer 1 for the valuable advice. But we're not sure Reviewer 1 was referring to the new manuscript because reviewer 1 seems to read the initial manuscript before it was revised. In the revised manuscript (1st round), I changed this very phrase because this issue was also asked by Reviewer 2 in the first round of review. However, it was purely our mistake. We should not use "therefore" from the beginning. Hence, we have deleted the "therefore" word since the 1st round revised manuscript. So the new phrase is "...course satisfaction can be interpreted as the relationship between students' expectations and what they actually get. Students with high course satisfaction will tend to earn higher grades in their final exam." Regarding reviewer 1 suggestion to put more elaboration on the rationality of the hypothesis that course satisfaction has a significant positive direct effect on academic performance (i.e., H3), we have accommodated it. Thank you for reviewer 1 valuable comment.
- Method: "The authors used error measurements of type one and two at $\alpha = 0.05$ and $\beta = 0.95$, while the effect size = 0.15..."
(1) The power is 0.95, not the β is 0.95. Power = 1 - β .
(2) Is there any reason to set the effect size as 0.15? Without any explanation, it seems a bit arbitrary..
Thank you for pointing this out! We have changed the explanation regarding the power. The explanation and references about the reason for setting the effect size as 0.15 also have been added.
- As mentioned in the first round of review, why cannot self-regulated learning directly lead to academic performance? Have the authors reviewed the literature which claimed that self-regulated learning can directly lead to academic performance? Please provide more support for the model in the study.

Thank you for your advice. We did not assess the direct relationship between self-regulated learning on academic performance because, in this study, the relationship between self-regulated learning and academic performance is not significant, yet still positive. However, to be highlighted, our study is unique because this study used samples in the online learning environment instead of regular classroom setting. From that basis, we only report the mediation effect instead of the direct relationship counterpart. Also, based on the previous study, self-regulated learning and digital literacy are known to influence academic performance directly, but previous research has only focused more on the regular classroom setting (Bail et al., 2008; Leung & Lee, 2012; Lucieer et al., 2016; Vrana, 2014).

Reviewer 2:

- The title can be revised as: Key Factors to Foster Academic Performance in Online Learning Environment: Evidence from Indonesia during COVID-19 Pandemic. Please pay attention to the prepositions.

The title Reviewer 2 suggested here is the initial title for the manuscript that we had provided. At the first stage of review (1st round), Reviewer 2 recommended adding "an" before "Evidence". However, at this review stage (2nd round), reviewer 2 suggested removing the "an" prepositions. So we are quite confused about which title we have to use. But at this stage, we accommodate the last suggestion of reviewer 2, so we have removed the preposition. (Final title: Key Factors to Foster Academic Performance in Online Learning Environment: Evidence From Indonesia During COVID-19 Pandemic).

- Self-regulated learning section: the cohesion between the paragraphs can be improved. Thank you for reviewer 2 advice. The suggestion has been accommodated.
- Digital literacy section: “Thus, someone is considered to have digital literacy if they know how to use a word processing application such as Microsoft Word.” “Someone is” and “they”, please keep the singular and plural consistent. We really thank reviewer 2 for this valuable suggestion. The suggestion has been accommodated.
- Digital literacy section: “The importance of technology is not only seen ...and relevant experience (Burton et al., 2015)”. The language quality of these sentences can be improved. Thank you for pointing this out. The improvement of the digital literacy section has been made.
- Result section: “HTMT is considered to have a more...”. We really thank reviewer 2 for this valuable suggestion. The suggestion has been accommodated.
- “The present results are significant in at least two major aspects”.. We really thank reviewer 2 for this valuable suggestion. The suggestion has been accommodated.

- “We have methods to approach the content, methods to make us get closer to the learners. Some methods of approaching students can in fact push us very far from the student” (Horton & Freire, 1990).

We are sorry, but we do not know in what part we need to change this phrase because the suggestion reviewer 2 gave the same as what we wrote in the manuscript. Thus, we tried not to change this phrase because this is the exact quote that we took from Freire's book.

Key Factors to Foster Academic Performance in Online Learning Environment: An Evidence From Indonesia During COVID-19 Pandemic

Thamrin¹, Reza Aditia², Saidun Hutahun³

^{1,3}Faculty of Economics, Universitas Negeri Medan, Indonesia

²Faculty of Teacher Training and Education, Universitas Muhammadiyah Sumatera Utara, Indonesia

The unprecedented COVID-19 pandemic has changed many aspects of society, including education. While online learning aims to avoid the transmission of viruses, however, what causes the success or failure of online learning needs to be investigated. This study tries to answer the question by analyzing how self-regulated learning, digital literacy, and the mediation of course satisfaction influence students' academic performance in online learning situations caused by the COVID-19 pandemic in Indonesia. We employed Partial Least Square Structural Equation Modelling (PLS-SEM) on 358 respondents gathered from an online survey questionnaire completed by undergraduate students during the pandemic. The study finds that self-regulated learning is the key factor, followed by digital literacy. Course satisfaction also proved to mediate self-regulated learning and digital literacy on academic performance.

Keywords: Indonesia; PLS-SEM; online learning; self-regulated learning; digital literacy

Introduction

It has been two years since the COVID-19 pandemic was officially declared to have entered Indonesian territory. Many aspects of society have changed caused by social distancing, from partial until full lockdowns. Numerous things are becoming the new norm today, such as people being required to wear masks when in public spaces, places usually used as gathering places being limited in capacity and operating hours, and places of worship have been temporarily closed. Among them, the most striking thing since the pandemic is that teaching and learning activities in schools and campuses are

Commented [RA1]: Author response for reviewer 2 suggestion

Commented [RA2]: Author response for reviewer 2 suggestion regarding the phrase revision.

Commented [RA3]: Author response for reviewer 2 regarding to make clear about "what are these aspects".

not allowed and replaced with online learning, not only in Indonesia but school closure is also implemented throughout the global level. Following UNESCO recommendations, educational institutions are encouraged to replace the face-to-face learning process with online learning (Crawford et al., 2020).

The application of a learning management system (LMS) in online learning is challenging. This challenge comes from two sources. Firstly, it is caused by the physical absence of lecturers, and secondly is caused by the loss of the campus academic atmosphere, so that students tend to use their productive time to do other things besides studying (Elvers et al., 2003; Levy & Ramim, 2012; Michinov et al., 2011). Because online learning has powerful characteristics in self-autonomy, self-regulation has an important role in the process. If we reflect in the context of learning in regular classrooms, self-regulatory behaviors have been shown to play an important role in students' academic performance (Gonzalez-Nucamendi et al., 2021; Lan, 1996; Orange, 1999; Perry et al., 2012). If this behavior has a vital role in regular classrooms, then it can be expected that self-regulatory skills will play an even much more critical role in online learning, where students are isolated from each other in their respective rooms, because the lack of self-regulation can lead students to negative traits, such as procrastination (Hong et al., 2021). Students who lack self-regulatory learning skills are suspected of manipulating their self-autonomy so that the learning tasks they should have completed in online courses are unfinished.

In addition to self-regulated learning, the ability to use digital devices, or known as digital literacy also plays an important role here. This is because online learning is not only about using devices to access the LMS, but also how to synthesize information and prevent risks that may occur when accessing the internet (Rodríguez-de-Dios & Igartua, 2016). If the understanding of literacy in the past meant demonstrating the

Commented [RA4]: Author response for reviewer 2 regarding the elaboration and suggestion for updating the references.

Commented [RA5]: Author response for reviewer 2 regarding this statement is not solid from the academic perspective. Therefore, I have added a reference as my base to rebut reviewer 2 comment that my statement is not solid from the academic perspective.

capacity to extract sense from what they read (Prior et al., 2016), then digital literacy also has similar characteristics, because the skill to read and to write was not enough to identify a person as being literate (Miranda et al., 2018). A person can be said to have digital literacy if they have the ability to understand and use various information that they obtained from a variety of digital sources (Gilster, 1997).

Researchers have revealed that self-regulated learning influences students' course satisfaction (Kuo et al., 2014; Puziffero, 2008; Wang et al., 2013). If explored further, course satisfaction is known to have implications for student academic performance (Blanz, 2014; Topalã, 2014). Also, based on the previous study, self-regulated learning and digital literacy are known to influence academic performance directly, but previous research has only focused more on the regular classroom setting (Bail et al., 2008; Leung & Lee, 2012; Lucieer et al., 2016; Vrana, 2014). However, as far as the authors know, there is no study about how digital literacy influences course satisfaction in the online learning environment, even though in the online learning process the use of digital devices is absolutely necessary. Regarding how course satisfaction in mediating digital literacy and self-regulated learning on academic performance also has never been studied before. Thus, this study aims to fill these gaps by investigating them. Again, this study becomes important because it captures a broader understanding of how self-regulated learning, digital literacy, and course satisfaction influence students' academic performance in online learning situations caused by the unprecedented COVID-19 pandemic in Indonesia.

Theoretical background and hypothesis development

Self-regulated learning

According to Zimmerman (2000), self-regulation is defined as self-generated thoughts,

feelings, and actions that are planned and cyclically adjusted to achieve personal goals. Meanwhile, Bandura (1986) states that self-regulated learning represents the relationship between triadic processes, namely personal, behavior and environment. Furthermore, when referring to Schunk & Ertmer (2000), self-regulation is a cycle when personal, environmental, and behavioral aspects experience changes during the learning process. In online learning, students have complete control over their learning. Thus, they must do things independently related to their learning, including planning, regulating, monitoring, and evaluating. Successful self-regulated learning is characterized by active engagement, adjustment, and readjustment of learning strategies according to various factors they met.

Students who carry out online learning need to be independent and autonomous, though they are also expected to be able to carry out self-management. Self-regulated learning has much in common with learners' ability to exert self-control, and previous literature has shown that aspects such as resisting temptation, resisting distractions, focusing on long-term goals, delaying short-term gratification, are all part of self-regulation (Zhu et al., 2016). But of course, in reality, this is not an easy thing to maintain (Elvers et al., 2003; Levy & Ramim, 2012; Michinov et al., 2011). Previous literature states that self-regulation in online learning settings tends to create learning difficulties for students compared to face-to-face learning (Lajoie & Azevedo, 2006; Lee et al., 2008; Samruayruen et al., 2013; Tsai & Tsai, 2010). Furthermore, if not managed properly, an unorganized profile from the aspect of self-regulated learning is associated with poor academic outcomes, such as a low GPA of students (Barnard et al., 2009).

Digital Literacy

The concept of digital literacy has changed in recent years, and even this term is often

Commented [RA6]: Author response for reviewer 2 regarding the suggestion to present the meaning of self-regulated learning from Zimmerman (2000), Bandura (1986) and Schunk & Ertmer (2000) should be presented first.

confused, as there is no general consensus among academics on its definition (Bawden, 2001, 2008; Hockly, 2012). Initially, this term expressly referred to knowledge of hardware and software. Thus, someone is considered to have digital literacy if they know how to use a word processing application such as Microsoft Word. Furthermore, along with the advancement of internet technology, until around the 1990s, some academics used this term to refer to the ability to read and understand the hypertextual text and multimedia (Bawden, 2001). Nevertheless, this concept is seen as more than just using the software or the device itself. Therefore, it relates to expertise and skills in the use of mechanics as well as knowledge and skills about using these devices for different purposes (Chisholm, 2006). The importance of technology is not only seen from the technology side, but the intellectual, social, and ethical use that we make and the concept of digital literacy must also be considered. It is relevant in today's class setting, while education really depends on technological use, even since the primary school (Buckingham, 2015; Casey & Bruce, 2011; Unsworth, 2005). In juvenile and adult level, digital literacy become a vital capacity in mastering not only for the sake of daily tasks and daily routines, but also in all sectors of society, including in higher education and professional world (Ahmed & Roche, 2021; Mohammadyari & Singh, 2015; Siddiq et al., 2017). If students have excellent digital literacy skills so they know how to use technology, it will bring them several benefits for their learning because technology gives students easy access to academic resources, makes them more productive, feel connected, and more immersive, engaging, and relevant experience (Burton et al., 2015).

Digital literacy can be interpreted as an individual's awareness, attitude, and ability to use digital tools and facilities appropriately to identify, access, manage, integrate, evaluate, analyze and synthesize digital resources, build new knowledge,

Commented [RA7]: Author response for reviewer 2 regarding digital literacy section

create media expressions, and communicate with others, in the context of specific life situations, to enable constructive social action, and for reflection (Hockly, 2012; Martin, 2005). Although today's generation is digital natives (Al-htaybat et al., 2018) and they are at the forefront of new technologies, it is not a guarantee that they will be able to use them wisely because today's generation has many difficulties managing information, assessing the credibility of information, building their digital identity, and manage privacy in their online activities (Fernández-Villavicencio, 2012). Furthermore, referring to Rodríguez-de-Dios & Igartua (2016), there are five dimensions of digital literacy, namely:

- Technological or Instrumental Skill
- Communication Skill
- Information Skill
- Critical Skill
- Security Skill

Course Satisfaction

Concerning terminology about satisfaction in education, it is often referred to by different names, such as student satisfaction (Xiao & Wilkins, 2015), learning satisfaction (Topala & Tomozii, 2014), and course satisfaction (Frey et al., 2003; Wang et al., 2013). However, this study uses the term of course satisfaction. In most countries, students are required to pay tuition fees, then, like consumers in business sector, their satisfaction needs to be considered by universities (Xiao & Wilkins, 2015). Referring to Rashidi & Moghadam (2014), course satisfaction can be interpreted as the relationship between students' expectations and what they actually get. Students with high course satisfaction will tend to earn higher grades in their final exam (Puzziferro, 2008). As a

Commented [RA8]: Author response for reviewer 2 regarding the confusing phrase.

result, the success of online learning is when students are satisfied with their learning experience, and then students experience success in learning the course content (Chang & Smith, 2008; Marks et al., 2005; Puzziferro, 2008).

Based on the theoretical grounding and previous findings, we propose five hypotheses as follows:

H1: Self-regulated learning has a significant positive direct effect on course satisfaction

H2: Digital literacy has a significant positive direct effect on course satisfaction

H3: Course satisfaction has a significant positive direct effect on academic performance

H4: Course satisfaction mediates the relationship between self-regulated learning and academic performance

H5: Course satisfaction mediates the relationship between digital literacy and academic performance

Research Model

The model proposed in this study can be seen in figure 1, which generated by the theoretical grounding and hypotheses postulated. In this model, self-regulated learning and digital literacy act as an exogenous latent variable. Meanwhile, the course satisfaction variable acts as an endogenous latent variable with a dual relationship as both independent and dependent, and the academic performance variable acts as an endogenous latent variable.

Method

Research design and sample

This study used survey research design as its research procedure. Survey research designs are methods in quantitative research in which researchers administer a survey to a sample or to the entire population of people to describe the attitudes, opinions, behaviors, or characteristics of the population (Creswell, 2012). Furthermore, the type of survey research design used is cross-sectional survey designs, where data is collected at one point in time (Creswell, 2012). In this study, the sample was selected using convenience sampling procedure. In determining the sample size, the authors followed the recommendations given by Hair Jr et al. (2016), where to determine the required number of samples, it should be in line with the statistical power. To calculate the required sample size and the statistical power, the authors utilized G*Power software (Faul et al., 2007). The authors used error measurements of type one and two at $\alpha = 0.05$ and $\beta = 0.95$, while the effect size = 0.15, and the number of predictors as the model offered by the researcher is 3, with 2 number of tested predictors. The calculation shows that the minimum sample required in this study is 107. Furthermore, the complete settings authors used to analyze the sample size and the results can be seen in Figure 2. The sample consisted of undergraduate students who studied in two universities in Indonesia.

Instrumentation and data collection

The instruments used in data collection in this study have been validated by previous research. The self-regulated learning variable uses the Online Self-Regulated Learning Questionnaire (OSLQ) (Barnard et al., 2009), the digital literacy variable uses an instrument developed by Rodriguez-de-Dios et al. (2016). Meanwhile, the learning

satisfaction variable was adopted from the Course Satisfaction Questionnaire (CSQ) instrument (Frey et al., 2003), and academic performance using an instrument that has been validated by Nayak (2018). All variables were measured by utilizing five points Likert scale, where 1 refers to 'strongly disagree' and 5 refers to 'strongly agree'.

In data collection, authors conducted a web-base survey among Indonesian students. The number of completed questionnaires was 358, where this sample size fulfilled the minimum sample calculated using the G*Power application (107 sample size).

Sample demographic background

Table 1 shows the background of the sample who participated in this study. The categories of all samples (n = 358) are divided into gender, university, and the most frequent devices used in online learning. More than half were female (69.55%), and the remaining were male (30.45%). In terms of universities, the number of samples from the two universities was still relatively comparable in size, with 201 samples from Universitas Negeri Medan (56.15%), while those from Universitas Islam Negeri Sumatera Utara were 157 (43.85%). Interestingly, based on the devices used in attending online lectures, the majority of the samples participating in this study used mobile phones in online learning, with a total of 300 (83.8%), and the remaining using laptops (16.2%).

Table 1. Sample demographic background

		Frequency	Percentage
Gender	Male	109	30.45
	Female	249	69.55
University	Universitas Negeri Medan	201	56.15
	Universitas Islam Negeri Sumatera Utara	157	43.85

The most frequent devices used	Laptop	58	16.20
	Handphone	300	83.80

Data analysis procedure

Because the constructs authors want to examine are complex and contain two layers of constructs thus, the hierarchical component models (HCMs) in Partial Least Square Structural Equation Modeling (PLS-SEM) were employed for data analysis. HCMs have two elements: the higher-order component (HOC), which captures the more abstract higher-order entity, and the lower-order components (LOCs), which capture the subdimensions of the higher-order entity (Hair Jr et al., 2016). Furthermore, the type of HCMs used in this study is reflective-formative type models (Type II). Regarding the approach to estimate the HCMs, there are three approaches to estimate the parameters in HCMs models using PLS-SEM, they are the repeated indicator approach (Lohmöller, 2013; Wold, 1982), the two-stage or sequential approach (Ringle et al., 2012; Wetzels et al., 2009), and the hybrid approach (Becker et al., 2012; Ciavolino & Nitti, 2013). However, authors used repeated indicator with Mode B formative measurement to estimate the parameters in HCMs in this study. The advantage of the repeated indicator approach is its capability to assess all constructs simultaneously instead of assessing lower-order and higher-order dimensions separately (Becker et al., 2012). Mode B for the repeated indicator also considered to be more appropriate referring to Becker et al. (2012).

In general, PLS-SEM chosen with the reason of the nature of this research is exploratory and predictive (Hair Jr et al., 2016; Henseler et al., 2016). In addition, the utilization of PLS-SEM is also preferred because it allows researchers to approximate complex models with many constructs, indicators, and structural paths without having

to worry about distributional assumptions on research data since PLS-SEM is non-parametric in nature (Hair Jr et al., 2016). Three main steps were conducted in analyzing the results: (1) evaluation of measurement models for first-order constructs, (2) evaluation of the first-order constructs on the second-order constructs, (3) evaluation of the structural model (Becker et al., 2012; Hair Jr et al., 2016; Ringle et al., 2015). The explanation for both evaluations will be explained in the next session.

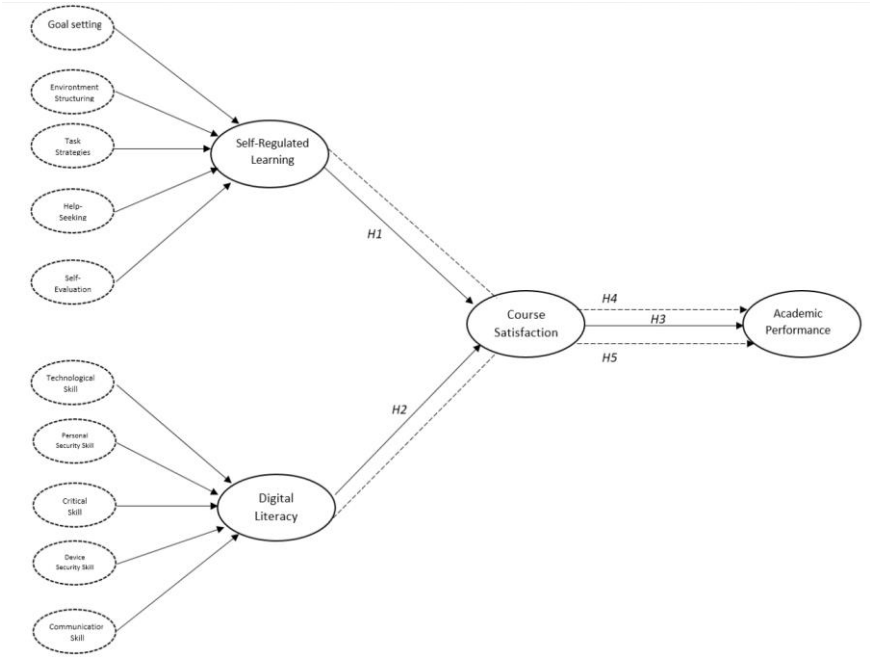

Figure 1. Research Model

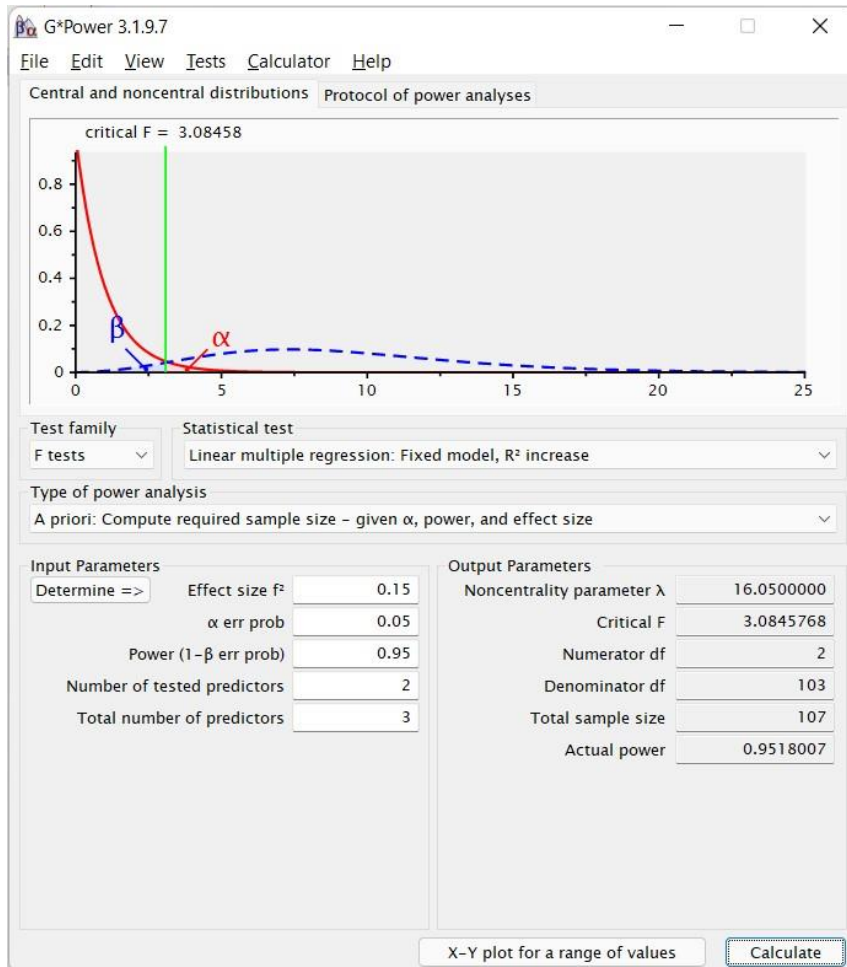

Figure 2. Power results for required sample size

Results

Evaluation of measurement models for first-order constructs

The first-order constructs in this study have reflective constructs. The assessment of reflective constructs involves convergent validity, internal consistency reliability, and discriminant validity (Hair Jr et al., 2016). Convergent validity is the degree to which a measure correlates with other measures of the same construct (Hair Jr et al., 2016)

requiring both loading factors and Average Variance Extracted (AVE) to exceed 0.5. Furthermore, internal consistency reliability is a form of reliability used to determine whether the items measuring a construct are similar in their scores. It required composite reliability and Cronbach's alpha to be above 0.6 (Hair Jr et al., 2016). The last aspect in evaluating the measurement models for first-order constructs is discriminant validity. While there are many approaches to evaluating the discriminant validity, such as cross-loading (Henseler et al., 2009), Fornell-Larcker criterion (Fornell & Larcker, 1981), and Heterotrait-monotrait ratio (HTMT) (Henseler et al., 2015). HTMT is considered to have a more accurate examination since cross loading and Fornell-Larcker criterion suffer to recognize discriminant validity issues (Henseler et al., 2015). For the threshold, the HTMT confidence interval must not include 1. For a more conservative threshold, 0.85 seems warranted (Henseler et al., 2015).

However, the results shown in Table 2 are the second run analysis. In the first analysis, the measurement that does not meet the requirements has been removed, namely SRL13, SRL14, SRL15, DL6, DL 7, DL8, DL22, DL23, DL24, and DL25. SRL13, SRL14 and SRL15 were parts of Time Management sub-construct from Self-Regulated Learning. DL6 and DL7 were parts of Technological Skill sub-construct from Digital Literacy. DL8 was one of the Personal Security Skill sub-construct from Digital Literacy. While DL22, DL23, DL24, and DL25 were parts of Information Skill sub-construct from digital literacy. Therefore, two sub-constructs were discarded completely: Time Management from Self-Regulated Learning, and Information Skill from Digital Literacy. Table 2 shows that all constructs have adequate convergent validity, internal consistency reliability, and discriminant validity. Nonetheless, the details of HTMT results can be seen in Table 3. Once it is confirmed that the evaluation

Commented [RA9]: Author response for reviewer 1 regarding reference to justify 0.6 as the cut-off value.

Commented [RA10]: Author response for reviewer 1 regarding the justification of the absence of some sub-constructs.

of measurement models for first-order constructs is viable, then it can proceed to the evaluation of the second-order constructs.

Table 2. Convergent validity and internal consistency reliability measures

Evaluation of the first-order constructs on the second-order constructs

The evaluation of the second order follows the same process or analogy used to evaluate the first order constructs (Chin, 1998). However, since the second order is formative, several researchers have emphasized that traditional validity assessments do not apply like its reflective counterpart (Götz et al., 2010; Hair Jr et al., 2016; Henseler et al., 2009; Petter et al., 2007). Fundamentally, formative models assume that the indicators have an influence or shape the construct (Hair Jr et al., 2016; Jarvis et al., 2003). It makes a different interpretation and evaluation of the measurement (Götz et al., 2010; Hair Jr et al., 2016). Thus, in general, the evaluation of the second-order constructs contains two steps: the indicator level (in which the first-order constructs now act as indicators), and the second-order constructs (Henseler et al., 2009).

In the first stage, we need to assess whether every first-order construct contributes to forming the second-order construct (Chin, 1998; Hair et al., 2011). However, as a reminder, we treated the path as weights instead of loading factor. Note that the weights obtained are the scores we obtained in the first stage. Referring to Andreev et al. (2009), the indicators' weight should exceed 0.1. Furthermore, bootstrapping should be employed to verify the significance (Hair et al., 2011; Henseler et al., 2009). Table 4 shows that all first-order constructs' weights are higher than 0.10 and have a significant level based on 5,000 bootstrapping, which means there is empirical support for the first-order constructs in terms of the construction of the formative second-order constructs (Hair et al., 2011).

Furthermore, it is necessary to assess the nomological validity at the second-order construct level. This validity manifested in the magnitude and significance of the relationships between the second-order formative construct with the other constructs in the model (Henseler et al., 2009). The results in Table 5 indicate a significant

relationship between second-order formative constructs in this study and other constructs in the model. It means the nomological validity has been met.

Table 4. Weights of the first order constructs on the second-order constructs

Second-order construct	Construct level	Weight	t	Mean	Standard Deviation
Self regulated learning	First-order construct Goal setting	0.29	29.13***	0.29	0.01
	Environment structuring	0.19	22.97***	0.19	0.01
	Task strategies	0.26	36.34***	0.26	0.01
	Help-seeking	0.25	29.44***	0.25	0.01

Evaluation of the structural model (inner model)

After the outer model is proven to be reliable and valid, then the inner model estimates should be examined for the sake of hypothesized relationships among constructs in the model (Hair et al., 2012; Hair Jr et al., 2016). However, PLS-SEM is different from CB-SEM. It makes the goodness-of-fit of CB-SEM not fully transferrable to PLS-SEM.

Therefore, the inner model goodness-of-fit in this study was evaluated following Chin & others (1998), Henseler et al. (2009), and Hair Jr et al. (2016) by assessing the f^2 and Q^2 effect size. Furthermore, the standardized path coefficients and significance levels with 5,000 bootstrapping allow researchers to test the proposed hypotheses.

Many researchers rely on R^2 to examine the explained variance of the endogenous constructs. However, since the second-order constructs in the model of this study use repeated indicators, surely the variance of the second-order construct will be perfectly explained, and the explained variance will be equal to 1. Therefore, another approach is used, known as the Stone-Geisser's Q^2 (Geisser, 1975; Stone, 1974). In the PLS-SEM application, this approach follows a blindfolding procedure and then tries to estimate the omitted part using the estimated parameters (Vinzi et al., 2010). In this study, researchers used SmartPLS blindfolding feature with the omission distance used was 7. This value follows the recommendation by Chin (1998) and Henseler et al. (2012) that omission distance should be between 5 and 10. For interpretation, if $Q^2 > 0$, it means the model has predictive relevance. However, if $Q^2 < 0$ it represents a lack of predictive relevance (Henseler et al., 2009; Vinzi et al., 2010).

Besides Q^2 , numerous scholars (Hair Jr et al., 2016; Henseler et al., 2009; Ringle et al., 2020) also recommended evaluating the effect size of each path using f^2 (Cohen's effect size) (Cohen, 2013). Values between 0.02 and 0.15, between 0.15 and 0.35, and over 0.35 represents small, medium, and large effect size, respectively (Henseler et al.,

Commented [RA11]: Author response for reviewer 1 regarding what recommendation of Chin & others (1998), Henseler et al. (2009), and Hair Jr et al. (2016) that the authors followed

2012; Vinzi et al., 2010). Similar to f^2 , this three level can be applied to Q^2 as well (Henseler et al., 2009).

Table 5 presents the path coefficients and the significance levels. The direct effects show that self regulated learning has a stronger effect ($\beta = 0.51, p < 0.001$) on course satisfaction than digital literacy ($\beta = 0.24, p < 0.001$). In terms of the influence of course satisfaction on academic performance, the path coefficient shows a significant effect, with $\beta = 0.11, p < 0.01$. Thus, hypothesis 1, hypothesis 2, and hypothesis 3 are supported. Regarding the indirect effect on academic performance through course satisfaction, the coefficient reveals that self-regulated learning ($\beta = 0.05, p < 0.05$) has proven to be important as well as digital literacy ($\beta = 0.03, p < 0.05$) in influencing academic performance of students. Therefore, hypothesis 4 and hypothesis 5 are supported. The calculation of f^2 effect size in Table 5 also shows that the path of self-regulated learning on course satisfaction has a medium effect size, while digital literacy on course satisfaction and course satisfaction on academic performance has a small effect size. The results in Table 5 also indicate that Q^2 effect size of exogenous constructs in the model of this study have an adequate effect size. Self-regulated learning and digital literacy were revealed to have large predictive relevance, while course satisfaction revealed to has a medium effect size.

Table 5. Hypotheses tests and effect size results

Hyphotheses	Coefficient	Mean	Standard Deviation	t	Result
H1: Self Regulated Learning -> Course Satisfaction	0.51***	0.51	0.04	12.02	Supported
H2: Digital Literacy -> Course Satisfaction	0.24***	0.24	0.05	4.85	Supported

Discussion and implications

This study aimed to explore how self-regulated learning, digital literacy, and course satisfaction shaped academic performance in online learning settings during the unprecedented COVID-19 pandemic in Indonesia. From the literature review, the authors hypothesized that both self-regulated learning and digital literacy directly affect course satisfaction, while course satisfaction directly influences students' academic performance. Furthermore, self-regulated learning and digital literacy are intervened by course satisfaction in the relationship to students' academic performance.

Our results found that self-regulated learning positively impacts the level of students' course satisfaction. This finding supports the idea of Kuo et al. (2014) that interaction, internet self-efficacy, and self-regulated learning roled as predictors of student satisfaction in online education courses. Furthermore, in Massive Open Online Courses (MOOCs) setting, Li (2019) finding also shows a similar result, that self-regulated learning strategy was a key variable in students' course satisfaction. Also, the empirical evidence in this study found that digital literacy predicted students' course satisfaction. This finding corroborates the ideas of Eshet-Alkalai (2004), who stated that digital literacy is a survival skill in this digital era, including in the learning process. That is why having an understanding of how to use digital tools in the learning process is crucial. Because if students do not have adequate digital literacy, students may experience a tendency to depression in the use of technology, or what is known as technostress, which will surely decrease the academic productivity of university students (Upadhyaya & others, 2021). Another important finding was that course satisfaction positively impacts the students' academic performance. These results match those observed in recent studies. A study

conducted by Bossman & Agyei (2022) proved that technology and instructor dimensions, e-learning satisfaction influence the academic performance of distance students in Ghana.

The mediating effects of course satisfaction proposed in our study suggest that self-regulated learning does not straightforwardly lead to a higher level of academic performance of students, but through course satisfaction. Similar results also applied to digital literacy. These results suggest that nurturing digital literacy and self-regulated learning ignites the students' course satisfaction, which in turn positively affects academic performance. These results support the idea of other scholars that course satisfaction has a crucial role in mediating one variable to another. Take an example of the research conducted by Ko & Chung (2014) that found student satisfaction has a mediating role of teaching quality of teachers and students' academic performance. Furthermore, Nye et al. (2021) also reported similar pattern.

The present results are significant in at least two major respects. First, digital literacy and course satisfaction do not only act as a stand-alone variable that impacts students' academic performance; it also needs a high level of student satisfaction at the beginning, so that students' academic performance can be fostered. And second, in the time of online learning, self-regulated learning acted as the biggest predictor of the students' academic performance. It means success online learning needs a high level of self-regulated learning from students. Practically speaking, in the community of students with low self-regulated learning, authors are really doubtful that online learning can run smoothly or have the expected outcome.

These findings may help us to understand the online learning situation in Indonesia. The discovery of this study found that digital literacy, while it acted as the second biggest predictor of academic performance, but it still held a high coefficient. It means digital literacy is important. However, as we can notice, Indonesia is a country with high inequality in many education

Commented [RA12]: Author response for reviewer 1 regarding the misleading phrase.

indicators, let alone socioeconomic status (Ikeda & Echazarra, 2021; OECD, 2018). Imagine, is it possible to have a high level of digital literacy while, in fact, many Indonesian children do not have access to the digital device in their home? Again, we doubt, except the government can guarantee the accessible of the digital devices. In terms of self-regulated learning, this study has important implications for using or developing the teaching strategies that can foster students' self-regulated learning. Dignath et al. (2008) suggest using what is called as self-regulated learning training programs. These programs proved to be effective, even at the primary school level. So the educator needs to realize that self-regulated learning is more likely to be nurture than nature. The educator can not just teach how to understand the subject matter but need to stimulate the self-regulated learning of students.

While COVID-19 is still around, but in Indonesia, the teaching and learning process started to be conducted in schools or campuses. Thus, online learning is no longer fully implemented. Many parties think that online learning should continue to be carried out to reduce the number of transmission and droughts caused by COVID-19. However, this study gives a glimpse that online learning can be successfully implemented, but still with a high level of caution of every stakeholder involved, in order not to let the noble ideals to be achieved actually plunge students into the abyss of ignorance. This study suggests that the government and educational policymakers move the learning process from the “virtual world” to the actual classroom as soon as possible, especially in Indonesia, where online learning readiness is not too good (Afrianti & Aditia, 2020). If online learning really needs to be conducted, blended learning platform is preferable to fully online learning because blended learning combines the benefit of both worlds (Dziuban et al., 2018), but still, the implementation needs an enormous amount of caution. As the finding from this study indicates, academic performance in an online

environment really depends on digital literacy capacity. If the students cannot use the digital device well, do not rely on technological devices to deliver your learning.

Commented [RA13]: Author response for reviewer 1 and 2 for the addition in the discussion section.

As a closing statement to hinder us from doing malpractice in education, we need to put what Freire said into heart: “We have methods to approach the content, methods to make us get closer to the learners. Some methods of approaching students can in fact push us very far from the student.” (Horton & Freire, 1990).

Key Factors to Foster Academic Performance in Online Learning Environment: Evidence From Indonesia During COVID-19 Pandemic
Cogent Education

Dear Thamrin,

I am pleased to tell you that your work was accepted for publication in Cogent Education on Jan 25, 2023.

Please note: only minor, or typographical changes can be introduced during typesetting and proofing of your manuscript. Major changes to your manuscript will not be permitted.

For your information, comments from the Editor and Reviewers can be found below if available, and you will have an opportunity to make minor changes at proof stage.

Your article will be published under the Creative Commons Attribution license (CC-BY 4.0), ensuring that your work will be freely accessible by all. Your article will also be shareable and adaptable by anyone as long as the user gives appropriate credit, provides a link to the license, and indicates if changes were made.

Once the version of record (VoR) of your article has been published in Cogent Education, please feel free to deposit a copy in your institutional repository.

Thank you for submitting your work to this journal, and we hope that you will consider us for your future submissions.

Best wishes

Morris Jong, PhD
Editor
Cogent Education

Comments from the Editors and Reviewers:

The authors have further addressed the comments given by the reviewers and editor articulately. Btw, I still observe that the manuscript is not fully aligned with the format of APA. Please pay attention to this again when finalizing the final version of the paper. Thanks.

In compliance with data protection regulations, you may request that we remove your personal registration details at any time. (Use the following URL: <https://www.editorialmanager.com/cogentedu/login.asp?a=f>). Please contact the publication office if you have any questions.

Dear Editor,

Thank you for your email. I am very grateful that my article has been accepted in Cogent Education. However, could you please highlight in what aspect or in which part the manuscript is not fully aligned with the format of APA so we can revise it more easily and accurately.

Best regards,
Thamrin
