

CHAPTER V CONCLUSION AND SUGGESTION

A. Conclusion

Having analyzed the data that have been presented in the previous chapter, it was found that the mean of experimental and control group in the post-test score are 71,25 and 61,25. It's mean that the mean score of post-test of experimental is higher than those of control group.

Since the value of t_{observe} was 6,4 with df (70) at the level significance (0,05) is higher than t_{table} 1,994 the alternative hypothesis (H_a) is accepted. So, from the calculation of the data, it can be concluded that semantic mapping technique significantly affect students' achievement in writing descriptive text.

B. Suggestion

The result of the study showed that the application of semantic mapping technique significantly affect the students' achievement in writing descriptive text.

Based on the conclusion, the suggestion can be stated as the following:

1. It is suggested to the teachers to apply semantic mapping technique in writing descriptive text because it provides an opportunity for the students to work creatively in writing and it makes students able to develop their ideas.

2. It is suggested to the students to keep applying semantic mapping technique in writing descriptive text because this technique is appropriate for the students' need.
3. Other researcher who are interested for further study (university students) related to this research should explore the knowledge to enlarge the understanding about how to improve students' achievement in writing descriptive text and search another reference.
