

CHAPTER V

CONCLUSION AND SUGGESTION

5.1 Conclusion

After analyzing the data and referring to some findings of the study, conclusions are stated as the followings.

- (1) There are two types of code switching used by the senders when sending their messages, namely situational and metaphorical. But, not all the situations of situational code switching are proven in this study. Some of them, the factor of participants' status and type of interaction do not work in this study since the study deals with written communication who enables the participants to edit the utterances they want to convey.
- (2) The code switching is used by insertion, alternation, and congruent lexicalization.

5.2 Suggestion

Relating to the conclusions that have been stated, the suggestions are presented below.

- (1) Since this study is limited on sociolinguistic and grammatical aspects of code switching, while the psycholinguistic aspect is not included, it is suggested to the other researchers to develop this research especially in finding the other types and processes of code switching in another written media like e-mail, twitter, blackberry message, and so forth.

- (2) Referring to the finding of this study that not all the situational factors of code switching found, namely participant status and type of interaction since the interactions between participants occurred through SMS (written communication that enables them to edit their utterances), it is suggested to the texters to keep the ways they interact as they want in order to create the distinctive feature of language used in SMS such as using code switching. Moreover, such switching can enable them to keep efficiency in texting.
